Can someone tell me what the voltage/amps is for an Atari 400. I have an Atari 400 without a power supply. I'd like to buy a replacement/substitute power supply. Can someone tell me if the power supply tip is positive or negative for this machine.

Thanks in advance

>

I know this is straying off-topic a bit, and I don't think I've read a
comic book in nearly 20 years, but...

Isn't Wonder Woman's Secret Idenity Diana Prince? (long before Diana was
Princess of Wales) I think Donna Troy is/was Wonder Girl's Secret Idenity.
Then again, maybe something happened to Diana and Donna grew up and took
over as WW. It's been so long. I mean, judging from what I see on the
drug store racks, look what's happened to Superman!

I've been lucky. Just a few months before our user group folded up, somebody donated a whole boxful of DD disks from an office that had converted from an old system. They were turned over to me as 8-bit Librarian, and were declared mine (as the only active 8-bit user left) when the club disbanded. Must have been about 300 of them, and I've only found about a dozen so far I couldn't use. That was 4 years ago, and I have at least half of them left.

TJ

PS: I've also picked up brand new unopened boxes of name-brand disks at garage sales for $1 a box or less.

supply to power one or both mechanisms.
>
>CU Mathy Van Nisselroy

John: Another problem with the XF551 drives other than making sure that they are well ventilated, is to secure the SIO sockets with some type of plastic rivet through the holes on the sides. If you don't secure the sockets and you plug and unplug your SIO cables a lot you will end up breaking the traces to the SIO sockets as these traces are very fragile. The same thing could happen on 1050's as well, but the traces seem to be stronger in them. If any traces are broken you can repair by inserting a jumper to bypass the break.

The power supply for the 400 is the same as for the 850/1050/XF551 etc. It is a 9v AC power supply with a 31 VA rating although my 400 originally came with one which only had a 15 VA rating.

1386. Problems with cubase audio 2.03 and atari falcon 030

Hi I'm new here.

I'm having problems with Cubase audio 2.03, the fact is that when I load the songs from the SCSI HD or from the floopy some tracks are corrupted and notes are missing, if i try loading again the song 3 or 4 times the problem desapears.

If anyone can help me please leave a message in the newsgroup or contact to me at solod@mx3.redestb.es

Thanks .

>It's COM for SpartaDOS and DOS XL and none for MYDOS/AtariDOS.Is that for some
>new DOS?

It's EXE because it's EXEcutable. COM is for COMmand file (external
to the kernal). The practice of using a COM extension for those
executables that are not considered external commands has become quite
popular in the Atari8 community and also quite inappropriate. That
didn't stop everyone from doing it. Ignorance breeds such situations.
Not being insulting here, I was ignorant of such terminolgy in my old
Atari8 only days as well. Later on I learned what that was all about,
with much help to SpartaDOS documentation.

>heard of?

Sorry Dan, but I had no knowledge of what you have seen or heard of.
smile Anyway, I know that most of the people in this group use
modern computers in addition to using/having used Atari8 computers.
Given that, most such people are aware of Word documents or Adobe
Acrobat PDF files. If you were not, then I appolgize.

>But I can't read PDF or "Word".Can't it just be text + GIFs?

Sure it could be just text and GIFs. But then you would not be able
to view GIF and text together. Word DOCs or PDF docs essentially are
just text with graphical objects placed in them when appropriate.
Just makes life eaiser and more convenient for reading or printing
(and clearer because of illustrations being next to the text that
relates to them). Obviously, this route is not more convenient for
those who only use Atari8 computers who do not have access to viewing
or printing Word or PDF documents. I would appoligize for this too
except that the whole point of this was to put the information on a
CD-ROM. I have NEVER heard of a CD-ROM drive hooked up and interfaced
to an Atari8. Basically what I am saying, is that those who would be
able to use the CD-ROM disc also would have no trouble handling PDF or
Word files. So your concern here I believe is rendered moot. I
suppose the only concern would be for an internet archive of this
stuff and someone using the internet with only a shell account and a
real Atari8. A poll please: how many of you actually access the net
via shell account and Atari8, AND do so exclusively without access to
more modern computers to do so?

>(were there pictures in the book???)

"Pictures" are not the only things that would be appropriate to scan
in as an image. Any special characters, certain tables or charts,

etc. that would be difficult to represent with purely textual
characters would need such special attention.

>Atarians can use the text (40-columns,who would actually print it all out?) and
>the GIFs (1-bit,the whole book is just black&white,using JVIEW).

>Atari ML programme that would re-format it to whatever I wanted.
>
>I mean you can make it any other bizarre ways you want,but leave us a text
>version so we can read the blasted thing!

I really gave it some thought before I offered my suggestion and
believe I offered sound helpful advice. I'm sorry you disagree. I
too wanted it to be the most readable and understandable. Fact is,
that may requiring seeing special charts or special characters, and
seeing them along with the related text. It also may mean being able
to print out the info into a document that is both neat and complete.
The solutions I offered accomplish that the best IMHO. Word and PDF
docs are cross platform compatible (especially PDF which was desined
with that sole purpose). Hell, even the federal and state governments
are providing forms, documents etc online in PDF. It is something
they are doing that actually makes some sense. I realize that my
800XL cannot read PDF, but my PC, Mac, UNIX box, etc. can.

Yes it is. If outbound email goes through a central SMTP server (which is common with a number of MUAs commonly in use) then mail that can't be delivered or returned ends up in the postmaster's mailbox.

People should not be using bogus addresses on email. Except for people who respond to remove requests, the spammers aren't getting email addresses from email.

For people that use the same program to post news and send email, it is a pain to change the address back and forth. And having them always use the munged address is bad advice.

For $22 (TwentyTwo United States of America Dollars) Best Electronics sells replacement mylars (that's the plastic sheet(s) inside the keyboard) for XE computers (and maybe others two, but all my computers are XE's).
You have to check though, if you have a What's_the_Name keyboard (one sheet of plastic. Best has developed its own replacement for it, which works really great on my 130XE.) or a Sugi_something/Action Technologies keyboard (one sheet folds around another
). My 800XE (yep, XE, inside it's got the "new design" 130XE motherboard with 64 x 4 chips. Only two of them, but there is room of two more and for the C025953 (gate array that REALLY does the bankswitching).
needs one of those. You'll find Best Electronics address (and I guess some info on the 800XE/European 65XE) in Michael Currents FAQ.

Files on a MyDOS single density (720 sector disks) can be read with DOS 2.5 (and vice versa) as long as you don't use subdirectories, but MyDOS 1040 sector disks can't be read with DOS 2.5, as you will get an error. They also use a different sector for the second VTOC sector in this density.

I hope those days are in the near future. Would be cool to know if two or more PBI devices could work on one PBI (XL or XE style) at once. Ofcourse they'd have to have differnet ID numbers, and you'd need a special card that'll provide the buffering (24
4 and 245 chips I guess) and the needed connectors, but that shouldn't be too difficult.

CU Mathy Van Nisselroy (BlackBox + FloppyBoard owner)

BTW anybody ever try to add a PBI to an XEGS? Should work! With a little buffering.

I recommend it too. On all but the really early versions, you can bend up one of the pins (not just anyone) and use two 3.5" drive mechanisms instead of one 5.25" and one 3.5".

One warning though. Make sure it's in a ventilated place. There are many pieces of crap in the Atari stable, but the power source inside the XF551 (not the power supply, but the stuff inside the drive) REALLY is a piece of ♦$%& (censored)

It will get hot when your using it with one drive mech, but with two drives it can get so hot, that the drive will occasionally place a sector 52 tracks to much to the outside of the disk. This will happen on both sides of the disk. At random moments.
So make sure it's ventilated well. Or even better, use a second power supply to power one or both mechanisms.

>You push them too hard and they just shut down.
>
>Bob

I've found an article somewhere that'll tell ye how to built a power supply for the classic Atari. Unfortunately, it was text only, no schematics. And I guess it had Radio Shack numbers all over the place. And those are hard to decode if ye don't live close enough to Radio Shack (as in: "other side of the ocean")

I'd love a project like that. Sure beats those dambed PC supplies. Thomas Grasel from Germany has a nice project. It can power two 8 bit Atari's at the same time. It even is protected against too much current. But because of this protection, you have to switch both computers on at the same time. And I don't really like that. And if I throw away the MiniTower, where am I gonna leave the stuff that's hanging from the BlackBox.

MEI has all you want, if you want to go mail order. They carry brand names as well as generics, but I believe the minimum order on generics is 100 and you have to order labels separately.

Another approach, which may work temporarily, is to format the HD disks with DOS 3 (yes, there IS a use for it) and then reformat with your favorite DOS. But this is not for long-term storage nor is it good for using these disks on another drive.

Not so fast. Somebody else posted a message in this ng about not being able to find 5 1/4", DD diskettes. He could only find HDs, which would not format properly.

It is possible to format an HD diskette with DOS 3, then go over the format with another DOS, and have a diskette that can be used temporarily ON THAT DRIVE ONLY.

So, there is actually a use for DOS 3.

1 - Do you know of a simple plug-in memory upgrade similar to the Yorky that used to be sold in the UK?
2 - Are there any menus other than NDOS and Speed Start Initializer that would allow full titles to be written for the files I want to load?
The two menus above have limitations:
For example, if I want to load a graphics viewer and ask for the directory, I won't be able to access it.
Thanks for your help!

Interesting, any one know why that might be? After all, a format just boils down to an SIO format command (either standard or enhanced density), which prepares the disk, followed by DOS writing the few sectors it needs (boot, VTOC, directory...). The SIO format should be the same regardless of the DOS used, as it's handled by the drive. If it fails with DOS 2.x say, then it should fail with DOS 3.0 too (assuming the same density is used for both). If it works then it must be the writing of the custom DOS sectors that's failing in other DOS's and not 3.0.

If the format is failing, then that would imply that DOS 3.0 doesn't check for or report the failure, telling you it was succesful even if it wasn't. If the write is failing then that suggests that DOS 3.0 either is using the write without verify SIO command, or again, that it isn't checking for failures. The other possibility is that certain sectors are more likely to fail a sector write than others, and DOS 3.0 doesn't set up these sectors on a format, where as other DOS's do.

And yet a second format with another DOS works. Do two formats with another DOS produce the same result as one DOS 3.0 format and one other DOS format? Does the DOS 3.0 format sound the same as the other DOS format? You can tell if a format is working by the rythmic chug-chug-chug of the drive vs. the chug-chug-snarl-stop sound repeated twice when it fails.

Still it sounds as if the disks are flaky at best even if DOS 3.0 can format (or thinks it can format) them.

I ordered some diskettes from Midwestern Diskette within the past year.
It cost me $20 for 50 diskettes but that was mainly due to their ~$5 charge
for an order. Basically,the diskettes themselves were about $10 or less.
These were brand new disks and they were smurf blue (whether that's a plus
or a minus, I'm not sure).

They were very courteous and the disks arrived within a few days.

BWI> delivered or returned ends up in the postmaster's mailbox.

I see what you're saying.

If you spam using a munged address, the bounces come back to your own
postmaster.

Gee, that's really rough. Maybe you shouldn't send email using a bogus
address. It damn sure has NOTHING to do with the original discussion,
which was "how do I modify my Usenet posting address so that peopel can
read it and spammers can't?"

BWI> People should not be using bogus addresses on email. Except for people who
BWI> respond to remove requests, the spammers aren't getting email addresses
BWI> from email.

That's correct. But we aren't talking about *sending* email.

BWI> For people that use the same program to post news and send email, it is a
BWI> pain to change the address back and forth. And having them always use
BWI> the munged address is bad advice.

People who refuse to get a newsreader (which can be had for *FREE* on
every platform, including the Atari ST and the Amiga) are simply going
to have to live with a lot of inconvenience.

Filters are NOT the answer.

Actually the, the ATR8000 came in many flavors:

16K version: Printing, Disk Drive, Serial
64K version: could do the above plus run CP/M 2.2
Co-Power-88 version: Limited IBM 8088 software compatibility 256K ram
Co-Power-88 512K version as well.

Lurie & Associates used to sell an MFM hard drive interface add-on card for the ATR8000, then you were Styling with the best of everything with that kind of setup.

I have been thinking about building a power supply that could power my 8-bit/the hard disk/the MIO/ and several other units all from the same box. Of course it would have overload protection and thermal protection and a cooling fan. Best of all I would make it have plug in cables for each item that I wanted to power. i.e. din connector for the 130XE - plug for the disk drive/MIO/hard drive or perhaps a general adaptor plug which could supply +5 VDC/+12 VDC/+9VDC/9 VAC/12VAC and could say handle 12 amps or around 145 watts of power. This way one could always build their own cables as needed for their system. Do you guys think that there is a need for this type of unit. I think I could actually build one of these for a reasonable price. I hate all the different power supplies that you have to have to power all the accessories. What a wire jungle that leads to. With this idea, you would have a single power unit that could power all you equipment and still have enough power left over for future items (CD UNIT/ZIP DRIVE or the like). Let me know what you think about my idea. If I get enough feedback I will see what they can be built for. Drop me e-mail at dwmoar@teleport.com

That sounds really weird. All low level disk ops, like formatting,
are in the firmware of Atari floppy drives, so the DOS shouldn't make
a difference.

Actually, disk drives start numbering sectors at 1, not zero.
Try sending a 1050 a command for sector zero and you will get an
error. Sector zero cimply does not exist on Atari drives. PC's and
other systems start at zero. Atari forgot this, and so indeed the
vtoc bitmat is skewed by one bit, so there is no vtoc bit for sector
720, and so, DOS cannot use it. Mydos and other DOS'es learned
from this mistake, but if you want to be compatible, that is a
problem. If you only want to read, simply reading the next sector
will give you sector 720 at some point, but Atari DOS cannot write
to that sector because as far as DOS is concerned, it does not exist.

Hi Darren,

> IIRC, the PC had the 8088, the XT the 8086.

Both the PC and the XT were based around the 8088. That said many XT clones were 8086 based as you got a worthwhile speed increase by using that chip.

But then, just to confuse things further, IBM decided to release a '286 based XT a few years after they launched the AT....

Hi, I bought an Atari 5200 Trak-Ball controller at a garage sale but it doesn't work. The buttons on the top work but the trak-ball itself doesn't. I think that the chips on the board inside may have been moved (or backwards) because when I bought it, it was taken apart and a couple of the chips were out. Anyway, could someone E-Mail me a list of which chips go where?

Thanks,

Riley

Greetings fellow Atarians,

A while back, some of you gave me some very good advice about how to clean my good ol' 800 keyboard out. Unfortunately someone spilled some soda on it when it was being moved. The machine still works fine other than the fact that quite a few of the keys now of course stick. One of you recommended a product from radio shack that I might be able to use to free up the keys. I had saved your message, but it got dumped into the old bit bucket somehow. So if any of you have any suggestions about this problem, I'd appreciate hearing them.

One more thing while I am writing to all of you, I recently picked up an 800xl with a 1050 at a yard sale. The unit works great, however I have noticed that some of my old games don't want to load. I have a dim recolection from the days when I had my first xl that sometimes you needed to load a little routine from disk, then the problem games would run fine. If one of you would refresh my memory on this, I'd sure appreciate it. Thanks much.

Hey Mark,

Ummm, where on Earth did you get that info about the 1450XLD disk drives??? I own a few 1450's and no, they don't work like that and yes DOS 4 (Quad DOS) was for the 1450XLD disk drives. The drives are ds/dd and no the backside of the disk is NOT D2: as for DOS 3.0 it was simply a HUGE mistake of a DOS from Atari, best left in the box and never used.

: (and un-like the Apple)

The definition of "OS" in relation to the Commodore 64 has been the biggest problem I've had with this whole Atari/64 debate. BASIC is indeed distinct from the Kernal. However, because it's what every 64 user sees upon startup (unless they're using a supercartridge or a wild hack), many consider it their "operating system" because it is the least common denominator way to access files, perform disk operations, and so forth.

Thank you Kyle for injecting the truth here.

While my views on just exactly what net-abuse is may be in direct
opposition with many people here, the solutions which I advocate are
equally as valid as anyone else's, and I find it extremely distasteful
when people try to muddy the waters with unsubstanciated propaganda
rather than just facing a problem head on.

I've never claimed to be a saint, but I fight for what I beleive in, and
no-one can ever justly accuse me of doing anything which isn't honorable
and above board to the best of my knowledge.

The Shadow

>(i.e.constantly changing the POKEY sound registers,usually once a jiffy)

I'm an ex Atari ST demomaker, and an Oric programmer...
Considering that it is possible to replay digitized sounds with only a poor YM-891x that only knows how to play square waves, on the ST as on the Oric (at 8khz with the 1mhz 6502).
Considering that people manage to add SID voices in Atari ST music player (with a timer that changes the frequency/volume of one of the channels, many times per frame),
It sound possible to replay a kind of SID sound on a Atari 800 machine. But do not expect to have many processor time left !

Atari Classics had an article about doing just that in one of its
issues, schematics and all. Trouble is, the RGB is not recovered
directly, but is a set of the intensity values. This gives you a visible
screen but all the colors are off. The sync is easy - the color is not.

The way I did it was to use an XEP80 (remember those?) and there were four wires or so you would connect inside and have a DB-9 plug for the monitor. Worked really well, had razor sharp output on a TTL monitor!

1442. Re: How do you make a Megaimage?

On 10 Feb 1998 21:38:33 GMT, crow@coos.dartmouth.edu (Preston F. Crow)
wrote:

-Several things to keep in mind with disk images, density, and DOSs:
-
-1. If you're using 256-byte (double density) ATR files, there seems
-to be some confusion as to whether the first 3 sectors are stored as
-128 bytes or 256 bytes. I'm quite certain that an image I created
-with an old version of SIO2PC only stored 128 bytes for the first 3
-sectors, though I've seen other programs that compute the offsets
-within the file based on the first 3 sectors being 256-byte sectors.
-I therefore suggest avoiding double-density disk images, unless
you're
-willing to deal with the potential hassle.
-
Yes, the 1st 3 sectors are always single density.
-
-3. A number of games save the high scores by writing directly to
some
-sector that wasn't used in the original distribution. While often
-this was sector 720, it wasn't always (I remember hacking Wizard of
-Wor to change it to 720 at some point). I would definitely recommend
-leaving that sector free. In fact, I would consider for very large
-images leaving all of the first 720 sectors free! (This may require
-creating a large blank file and then deleting it when you're done.)
I
-assume that this is the reason that several of the famous mega-images
-contain corrupted files.

None of mine do. I primarily use Ape on an actual atari and use ape
to write protect the image. additionally, I attrib the image on the pc
to "read only" so if I do run it from an emulator it will be fine.

-
-BTW, does anyone know the byte code that I would see in a file that
-uses the OS to do sector I/O? I think it was a "JSR ($E453)" or
-something like that. I could probably modify my binload program to

Thats one of them. You also can look for JSR $E459 and for naughty
programs, Jsr somewhere in the $Fxxxx region. (not using vectored
points.... almost sure to be different in osa osb osxl osxe...)

I just personally had wished that if anyone had to have bought Atari, inc from Warner at the time it would have been Nolan Bushnell or my second choice: Phillips Electronics who had stated an interest in Atari at the time. Tramiel knew nothing about videogames and didnt want anything to do with videogames and that blew any chances of Atari lasting. Quite frankly I loved the 8-bit's, they were my first computers and go me to where I am today as a computer engineer but they were doing very poorly in the marketplace with them. Atari needed peripherals like the 1090XL to give the 8-bits the shot in the arm they needed, also the 1450XLD as much as I love it was a total waste of time and resources. They should have taken the 800XL motherboard or the 800XLF (800xl with a Freddie installed on it with the additional 64K of memory, OH!!! I'm sorry, most people call it a 130XE, yup thats right the Tramiels didn't even lift a finger on that one either, they just repackaged the Atari 800XL-F) well back to my story, take the 800XL, the Freddie and the 1090XL and combine then into 1 motherboard, yup, 1 motherboard and then place it into a case that it like 2 1090XL's side by side, add a detachable keyboard and Wham! The 1600XL of the Atari 8000, whatever the name, that would have been the PERFECT 8-bit system!!!

I didn't have all that many tiny files like that... So the extra speed,
features, and ease of use of DOS 3 made it well worthwhile.

> Wow. That's the first I ever heard of that. What did it come with?
> Light Gun? Which games?, etc.

It came with a built in Missile Command game and a lightgun with the awful
Barnyard Blaster.
Because of the lack of a keyboard there weren't many systems sold here in
germany.

And ATARI had a strange policy. Not every reseller was allowed to sell
8-Bit-stuff.
Most of the dealers were only allowed to sell STs. :-(

>>Am I to assume they had a different box than the one used here?

I suppose but unfortunately I don't know wether the german nor the U.S. box.

Tschuess,
Frank

1448. DOS 3

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-12 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6buffj$2gu$1@newsd-199.bryant.webtv.net>
Source record: 66097

Hmmm. I knew I'd open a can of worms when I started this thread...

Anyway, I've been an Atari user since 1979, and if anyone thinks DOS 3 sucks, then try using DOS 1. There was a reason it was replaced with DOS 2.0S.

The 1k block size was rather large for the size of the disks back then, but for those who use hard drives and have one big partition- have you looked at how large the blocks are???? And who would write files of only 250 bytes? What in the world can you fit into 250 bytes that isn't machine code? Even if you did have a bunch of little piddly files, you could still have at least 127 files on the disk (each file taking up 1 block) Now who out there has even half that many files on a disk? I always thought the whining about the block size was a red herring. The problem is that people got used to seeing sectors, so when you threw blocks at them, most had a brains lock up.

One thing that would give you more room on a disk is to have a basic boot disk with all the DOS 3 files, and then have your files on data disks without the DOS 3 master files. Of course you need two drives to do this, but two drives are a necessity.

In any case, I ended up collecting other DOSes, and even experimenting with the so-called Atari DOS 4. Now that was rather a pain. And the compatibility between DOS 2 and DOS 2.5 extended sector was a hack.

Oh well...

1449. DOS 3 format information

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-12 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6bufsl$2ha$1@newsd-199.bryant.webtv.net>
Source record: 66098

DOS 3 formats a disk differently than the generic DOS 2.0S format. The files and the directory are in a different part of the disk. That is why you had to use the convert function of DOS 3 to read a DOS 2.0S disk.

So it seems possible because DOS 3 formats differently that DOS 2.0S, it could format HD disks.

HOWEVER, I have tried to format HD disks in the distant past with DOS 3 and it didn't work then... It would try to verify the format and then it would puke in the HD disk.

By the way, Office Depot still carries DS/DD disks, and some stationary stores still have a few on hand.

1450. DOS 3 buggy? Well, no.

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-12 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6bug53$2hk$1@newsd-199.bryant.webtv.net>
Source record: 66099

Now, over the last twelve years or so, people have said that DOS 3 is buggy. But no one has ever been able to tell me what those bugs are.

I've used DOS 3 for a long time, and not once have I lost any data.

Can anyone remember what the bugs were so I can try to verify them, or were they just scare stories so that you had to buy SpartaDOS?

Yes, though it seemed that towards the end of the life cycle of the
8088/8086 most XT clones were 12 Mhz 8088s. 8086s were more common,
ironically, in the early days. I am not sure why; was there a
compatibility issue?

> But then, just to confuse things further, IBM decided to release a '286

I did not know that. That is interesting. Now I will be opening the
cases of all the true-blue XTs I come across...

1452. ED Disks?!?!? Oh my god!

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-12 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6bugkc$2i6$1@newsd-199.bryant.webtv.net>
Source record: 66101

Oh geez. ED disks are expensive, and DD disks are cheap. ED disks will just NOT format in an Atari.

Too bad that no one could adapt an ED disk drive, 130k vs. 2.4 Mb? Gee, with an Atari, who needs a hard drive? One box of ED disks would be plenty for most users- (24 Mb was huge back then in 1978)

Anyway, remember-

DS/DD disks. Not HD, especially not ED. And notch those disks to format the back sides.

1453. DOS 4 for 1450XLD?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-12 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6buhj7$2iv$1@newsd-199.bryant.webtv.net>
Source record: 66102

It was mentioned that DOS 4 was written for the 1450 XLD drive.

I would say not so.

As I recall, the XLD drive was a double sided drive, with a weird twist. The back side of the disk was referred to as D2:. So, if you had a two drive XLD, then you had the equivalent of four disk drives.

DOS 3 was written for the XLD drive, because there are some commands in DOS 3 (like copy) that ask you if you are using the same disk or not.

In other words, if you said during a copy function, that the copy is on the same disk, then the copy from D1: to D2: would use the same drive. If you were using two 1050 drives, then you would say no, the command is not to use the same disk, then it would copy between the two drives.

Confusing? Well, if you were used to the 810 drive, yes. But once you became used to DOS 3 and the XLD drive, no problem. However, I've heard the XLD drive was flaky, at best, and of course many people were resistant to change their DOS. (Sounds like why people used MS-DOS/Windows over OS/2)

Now I'm not sure, but was DOS 4 a real Atari DOS, or was it a modified DOS 2 with extra menus?

1454. Austin 80

Newsgroup: comp.sys.atari.8bit

There were (at least) two versions of DOS 3. The early version did have some bugs in it. A later version fixed the bugs, and had an insert in the manual describing the bugs. Unfortunately the insert was just a loose sheet of paper and very easy to lose. I can't remember what the bugs were now, and haven't got the manual with me to check if I've still got that insert with it.

Whether the later version solved all the problems, or introduced any new ones I don't know.

That's what I didn't like about SpartaDOS X.It tried to be a whole other OS.
You couldn't access stuff like setting/getting the current drive.And it seemed
to throw away the whole Z: device way of accessing the time/date.
(that plus the stupid end-of-file update-mode bug!)

>>GEOS itself would
>>not be "64 compatible" by your definition since it throws BASIC

>constructed, a net device would work with *existing* Atari software
>just like any other device.

My sentiments exactly.But I imagine a way to add device handlers to the
Commodore would be to copy the OS to RAM and patch it so that access to certain
device numbers gets transfered to a special routine.But the whole single byte
PUT/GETs way of doing things is another problem.
Commodore sure was short-sighted!

>>What, exactly, would you consider to be "running under the Atari
>>OS", if such a thing were to be implemented on the Atari 8-bit?
>>That new menu items be added to the MyDOS menu, like "ping",
>"traceroute", and so forth?

Well the DUP menu is really just for D: device stuff.Now a NUP menu for the
N: device would be alright.DUP really has nothing to do with the OS.

Well,yes!
When you're in GEOS you can use normal Commodore programmes that need the
"kernal".

>Your assertions that in order to be worthwhile and respectible
>anything (in this case a TCP stack) have to run under the BASIC
>interface are nonsensical.

What does BASIC have to do with it?
This isn't IBM or Apple where BASIC is built into the ROMs.
(not the main ones,anyway)

I've never seen most of those addresses listed.They seem like so routine addresses that they used to give in assembly language primers that refered directly to routines to print characters and so forth that oonly worked on the original Atari since Atari never meant for anyone to bypass the CIO. Commodore must've been terrified to make even the smallest change to the kernal.
(and isn't "kernal" a misnomner.I thought a kernal was the main routine that called other "sub-routines".Like UNIX.On the Commodore it's the other way around.The game/utility/whatever is the kernal and the OS is the sub-routine)

You need one of those RS232 cartridges.Speaking of which:how do term programmes
use a MODEM connected to anything other than the user-port?
Does it actually add a device number like you explained?
OR do you have to have a term programme specially made for that type of
non-user port interface?
(I've always wondered!)

>:CONT LDA BUFFER ;Character in .A
>Note however that things like Input will read all chars into the
>buffer (no get/store loops at your end).

But you can also do Apple/Commodore one-byte PUT/GETs via the accumalator by
setting the buffer length to zero.

LDX #blah ;channel number*16
LDA #$07 ;GET
STA ICCOM,X
LDA #0 ;Buffer length
STA ICBLL,X
STA ICBLH,X
JSR $E456 ;CIOV handler
BPL :CONT
JMP ERROR

The character is now in the accumalator.
(I just modified your example since I've still to find my "Mapping the Atari")

Also doing it the Commodore/Apple way won't let you do Burst I/O.
Which is basicly un-buffered I/O like you get with disk drives under UNIX
(not Linux)
via the character device instead of the block device.

So unless Windows CE programmes are interpreted,
(like BASIC programmes)
instead of machine language,you won't be seeing Windows CE on the Atari.
There simply wouldn't be a CPU to execute the machine code meant for the
RISC-type CPU.

And hence the IBM tradition of accessing hardware ROM routines directly instead
of going through the OS.
(that's what ANSI is for)

>correct?)

Well ALL devices have to go through HATAB (handler table).
HATAB is a list of device names (one letter each) and the location of a set of vectors,one per CIO operation plus a "XIO" vector for special device specific functions.
You have:
OPEN
CLOSE
STATUS
READ
WRITE
XIO

If the CIO doesn't understand the function code you give it it assumes that it's a XIO (like UNIX's IOCTL) and hands it over to the XIO vector,in which case the handler totaly handles the job for the CIO.
(all standard CIO function have some involvement from the CIO)

>The user/programmers never have to deal with any hardware stuff.
>All the programs need to know is how to talk with the HC layer to
>accomplish the given task. The only thing that bothers me about

I'm a bit confused.You seem to be saying that Windows CE programmes are like
BASIC programmes.That is,they are some kind of symbolic code instead of real
machine language.What we call a interpreted language.
So if you had a ML programme on the IBM that understood the symbols that Atari
BASIC uses then you could run Atari BASIC programmes on the IBM.
(but you'd have to deal with the different OSes)
But many of Atari's BASIC programmes include machine code thus ruining that
idea.

>this is that the Atari 8-bit systems are perfect for dealing
>directly with the hardware. That's most of the fun!!! Sure, you'd
>be able to run you WinCE apps on your 8-bit, but you lose the
>pleasure of the "craft" and control of the system. My biggest thing

IF Windows CE is anything like normal Windows then it's pretty crappy.
No srpite support to be seen in there.

>about using PCs is that they are NOT easy to program in languages
>like BASIC. Since BASIC is basic and relates with hardware, it's a
>little hard to deal with Windows. The programming languages for Win
>are much more complex. Maybe someday I'll learn one of them
>(probably VB).

Actually only the SOUND command actually deals with the hardware directly.
Eveything else in AtariBASIC goes through the OS. (i.e. the CIO)
The Atari OS doesn't have any support for the sound part of POKEY.But then it
was never needed.
(there's no importance in altering sound registers during vertical blank like
there is with graphics)

Of course you can use POKE to access the hardware directly,but you can do that
with any language.(don't ask me about Windows!,I don't DO WINDOWS!)

Actually I don't run Xformer from any particular directory.I can run it from
any directory and it works alright.I guess it must have the BASIC & OS ROMs
built in or something.Really nice since my Atari stuff is spread out all over
the place.I HATE programmes that make you run them from a certain
directory.(besides games,of course)

I don't know,the file version of Archon 2 acts kind've funny during the opening
demo when the characters run onto the screen but is fine from then on.
And that's on a real Atari and disk drive.
Some disks may have totaly fine sectors with no errors,nor special headers,
but the skew is such that the timing is different.It's all rather complex.

>Mostly the keys dont seem to work right on those games, its probably
>the original programmers using some kind of esoteric custom keyboard
>routine rather than the one built into the o.s. and the timing is
>off

I don't quite understand what timing there would be to be off.
It seems simple to me:make the current key being pressed appear at a certain
memory location of the 6502.
(which would probably mean that the emulator would have to access the IBM
keyboard directly to defeat the (rather anoying) buffer)
But then again I'm some what absent minded.

While it's a neat concept,he really has to work on the interface.Like being
able to type in longer pathnames.And the problem of programmes seeing single
sided disks as double sided thus causing formatting and file system fixers to
see a disk twice as big should also be fixed.
(VTOCFIX and SDX's FORMAT are affected by the bug)

>so on.

Actually the extention is meaningless.You always have to type the whole thing
out.The proper extention is OBJ.IF you're using MYDOS then you can forget the
extention and just type 11 character filenames.
(MYDOS will assume that characters after the eighth are meant to be the
extention and automaticly put in the period for you)

If you're going to use DOS XL or SpartaDOS then you should use COM as the
extention since that's what the command processor (their version of DUP)
expects.

There is no EXE extention on the Atari.

Seeing how much memory A65 internet programmes would need,I'd go with a Atari
specific solution.For instance,you could telnet using a R: style device and
term programmes.A simple stream-socket device would allow all sorts of
services.You'd probably also want datagram support.

1479. Can you recognize an Atarian when you see one?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-12 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <6buvedobl1@alexander.INS.CWRU.Edu>
Source record: 66128

Why I love Atarians

I've been to a number of Atari Fests and shows. There is always an 'Atari' feeling at these places. I will now describe the 'typical' Atarian, a composite of characteristics all in one person.
TYPICAL ATARIAN:
A male. (He may have a female around someplace, but she is hoping something might someday come of this 'Atari' stuff.)
He has a rope for a belt. His glasses are so dirty you can't see his eyeballs, which are one looking to the right, the other looking straight at you. It is sometimes difficult to determine which eye is looking at you. Or the glasses are sorta pink with age and so thick you can't see the eyeballs.
He is selling a keyboard overlay that looks like it has been in a war, for $15.
He's got a collection of disk drives, electronics projects, old books and magazines. Atarians can only sell this stuff to other Atarians. He thinks this is good stuff.
Well, I can't think of any more, but if you're reading this and recognize yourself, you're an Atarian like me.
Russ Gilbert

1480. Re: binary load overwriting dos?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-12 00:00:00 UTC
From: The Shadow <The_Shadow@spnt.com>
Message-ID: <34E30293.B7BB0200@spnt.com>
Source record: 66129

Usually what I do, is start by zeroing all memory above memlo, this insures a clean slate in case the program is expecting one, and it won't harm anything anyway.

Then I go out and read the first 6 bytes of the file, to determine first if it is actually a binary file, and the load address and length of the first segment. Then I set the run address to the intitial load address, just in case the program doesn't set it later, such as in some of the Sparta-Dos .COM files. I then set the load buffer area to equal that of the program, and read in the first segment directly to where it wishes to reside in memory. Since you have already read in the first 6 bytes, exiting if the program doesn't start with 255 255, or if end address<= load address. Your pointer to continue reading is already at byte seven, to continue your burst IO load. You set # of bytes to load at end address-begin load address-1.

Now we go back for segment 2, which is a little more complicated. Grab next 2 bytes, if 255 255, toss them, and loop back to grab next load address, else continue with end address, set buffload to load address, and bufflen to end-begin-1. If load address=init, jump to init subroutine which will load next 2 bytes into init, and jsr through init, and then go back to second part of loader routine else continual loop through second part of loader routine until EOF, or end address <= load address. After EOF established, jump to run.

Burst IO will give you a MUCH faster load, and also eliminate the need to strip the last 3 bytes of each sector, or decide which DOS was used on the format etc.

Hope this helps...

The Shadow

>(i.e.no XIOs)

Well, I think they came about separately. I'll agree that the single byte idea is a drag -- that's a nice thing about the Atari I/O. Pardon my ignorance, but what's an XIO? The ioctl() I know is in sections 2 and 5 of the HP/UX system manual :-), allowing nonblocking and asychronous I/O.

>You need one of those RS232 cartridges.Speaking of which:how do term programmes

>Does it actually add a device number like you explained?
>OR do you have to have a term programme specially made for that type of
>non-user port interface?
>(I've always wondered!)

The 'RS232 cartridge' you refer to is the Turbo232, aka SwiftLink. Note that the Commodore user port is NOT a RS-232 port.

The user port is the only place such devices connect. Modems with RS-232 connectors are connected up with a converter to the user port as well -- I've never heard of a modem connecting anywhere else. Modems are invariably addressed as device 2 (in fact anything on the user port). I suppose you could do one off the serial port but that would be very messy :-) and you'd need an intelligent modem that watches for TALK and LISTEN signals to mediate traffic on the serial bus.

Hercules/MDA monitors are fixed frequnecy devices requiering digital
input signals
(TTL logic). (by the way CGA and EGA monitors offer multiple TTL
input lines for
color control)

Connecting them to any 8bit Atari would require re-digitalization of its
video output
and frequency conversion.

Let's not go there, please. He wan't removed for running a scam via our system. The official reason for account termination was a violation of our system rules. Specifically, rule #3 (You may not "Reveal your account password to anyone, allow anyone access to your account, or otherwise compromise system and account security."). The account was Donna's, not David's, yet he was using her account. If he'd have signed up under his own name, there wouldn't have been a problem there. Once we knew that she had given him her password, we closed the account down. There were some other issues, but this was the reason the account was closed. I was under the impression that The Shadow and aracnet had decided to agree upon disagreement wrt our spam management. If that wasn't the case....

1487. Re: DOS 4 for 1450XLD?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-13 00:00:00 UTC
From: jhardie@pipeline.com
Message-ID: <34e4b6bf.2396554@news.pipeline.com>
Source record: 65996

Dos 4, also known as Q-DOS was written specifically for the 1450XLD.
When Atari cancelled the 1400/1450 series, the rights for the DOS were
picked up by ANTIC magazine who sold the DOS in their Antic Resource
Software section.

By the way, 1450 drives are not accessed in the manner you mention.
They are DS/DD drives. I have seen rumours that some 1450's had 1050
Enhanced density drives in them, but the 1450's I own, as well as
others I've seen, all had DS/DD drives.

Dos 3 was written for the 1050 disk drive. It was the first DOS to be
packaged with the 1050 before they switched to DOS 2.5

Also, DOS 4 was a real DOS, written from the ground up. Not some hack
with extra options like 2.5 or 2.6f

Hope that helps,
John

Several of the megaimages from ftp.hackerz.com (or at least a few
weeks ago when the site was up) have corrupted files. I would not be
surprized if it was accidentally caused by direct sector writing for
high scores or such.

If you're curious, the following files have errors:

games003.atr Corrupted file (invalid sector 0): milliped.e
games003.atr Corrupted file (invalid sector 0): prexor
games008.atr Corrupted file (expected EOF, code 65, next sector 42441): anteater
games018.atr Corrupted file (expected EOF, code 125, next sector 5958): frogsnfl.ies
games021.atr Corrupted file (invalid sector 0): slingsho.t
games021.atr Corrupted file (expected EOF, code 91, next sector 42516): burgers
games021.atr Corrupted file (invalid sector 0): aquatron.exe

Those show up when extracting the individual files with my atr2unix
program.

I have an XEP80. It's output on the back is monochromatic composite,
which is incompatible with TTL. Are you saying that INSIDE the XEP80
there are TTL level (of the kind expected by a MDA monitor) signals
present? If so... do you have schematics?

-I don't quite understand what timing there would be to be off.

Yes, i agree, but who knows what tricks and cheats they had to
shoehorn into those games? Some kind of vlbank routines, tied to pokey
timers, etc. Doesnt pokey have something to do with inputs anyway??
(or just the paddle inputs, not the keyboard?)

-It seems simple to me:make the current key being pressed appear at a
certain

-

Thats strange; however, even though the site is sort-of maintained by
me (rather rarely, I'm afraid... not enough time) I did not post the
initial post there. There were restored from a backup that the
sysadmin there had to use. Maybe the errors came from there, or maybe
he played them before posting and caused the corruptions.
They do all work on mine, however. Not too many of the games you
mention above are that good, but the point of the archive, of course,
is to archive all I can get, regardless of my opinion of the files.

Some of us still have the ATR-8000. Personally I have three of them that came from SWP in Texas. (about $400 or so at that time) I have two of them with the hard disk interface card and also the 8088 processor. The one I use the most though is the stock 64K no frills machine. I use it primarily for the floppie drive, the printer and the modem port. It has been a very reliable work horse over the many years

GOD I am glad that you are not trying to help fix my broken computer. First no tech in their right mind would ever advise someone to "RINSE" their keyboard under warm running water.(but than maybe you were never a tech) DUMB DUMB DUMB. This is great if you want to do this to your own equipment, but please don't suggest that anyone should take this approach to working on theirs. Water and keyboards are not a good mix. Neither is soda for that matter.

The power supply for the 400 computer is the same one that works on the 800/810/822/850/1200XL/1010/1027/1050/and the XF551 it is a 9 volt AC adaptor rated at 1.95 amp. this is the one from Atari. The outside sleve is the negative and the inside being positive. You should be able to get this from B&C ComputerVision or Brad at Best Electronics. B&C's web address is http://www.myatari.com
Best Electronic can be reached at (408) 243-6950 for $15.00 part number CO17945 or CA017964. Hope that this helps you out

Didn't the unreleased double disk drive (815?) have something like that?
ISTR seeing a picture of 2 of these attached to an 800 i.e. 4 physical
drives with the illustration noting that this amounted to 8 logical drives
attached.

1503. More DOS 3 stuff

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-13 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6c14vm$4n5$1@newsd-199.bryant.webtv.net>
Source record: 66012

God, I love this...

Okay, I finally rebooted my 8 bit system, and ran a bunch of my old programs and stuff...

So, can anyone remember any alleged bugs in DOS 3? Does someone, somewhere remember an article in Antic, or any of the other contemporary computer magazines that described a bug? I'll have to assert that until someone out there in the cyber world tells me what the bugs were supposed to be, I'll have to say that there weren't any. Prove me wrong.

Now I know there was the bug with AtariBASIC revision B. I suppose I was one of the first DOS 3 users, I bought my first 1050 in 1983, and that is the date on my DOS 3 manual, revision A.

Now about the weird drive arrangement of the XLD drive, I'll have to find the documentation that described what I said. Now I could be wrong, I'll admit that, and of course, those that have 1450s have DS/DD drives. If I can find it, I'll post it.

1504. Fun with DOS 3 (or can your DOS do this? XIO commands)

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-13 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6c165j$4o3$1@newsd-199.bryant.webtv.net>
Source record: 66013

Okay, let's get a little tongue in cheek. Yeah, I'll even say that DOS 3 isn't the best in the world, but I was wondering if other DOSes can do certain DOS menu functions WITHOUT going to DOS. In other words, in BASIC, can one say, format a disk?

And for those who are wondering, here are some XIO commands...

```
Rename: XIO 32, #1, 0, 0, "D:OLD,NEW"
Erase: XIO 33, #1, 0, 0, "D:JUNK.BAS"
Protect: XIO 35, #1, 0, 0, "D:PRECIOUS"
Unprotect: XIO 36, #1, 0, 0, "D:OKWRITE.FIL"
Load binary: XIO 41, #1, 0, 0, "D:LOAD.FIL"
Format: XIO 254, #1, 0, 0, "D2:"
XIO 253, #1, 33, 87, "D2:"
single density
XIO 253, #1, 33, 127, "D2:"
enhanced density
```

Now I'm assuming that there are probably FORMAT or RENAME commands in say, SpartaDOS, but does having the DOS commands available decrease free program memory?

1505. 1450XLD parallel drive

Speak for yourself :)!!!

Actually, in the few shows I've been to, I've seen guys like that, but they weren't in the majority. I'd be willing to say that most Atarians are indistinguishable from other people. (There was one exception. The owner of Elfin Magic Software, a former fellow LIAUG member, used to go to shows in costume. He had the green outfit, the pointy shoes and ears, the hat with the red feather, etc. I still trade e-mail with him from time to time, although he's moved out of the area.)

But even if your composite is not well-groomed, his dedication does shine through.

Actually, all of those except binary load work under DOS 2.5, and I think if you leave off the specified density formatting modes, it is also true of DOS2.0S. In fact, I strongly suspect that that is true of DOS 1, too.

When you get right down to it, DUP is a pretty dumb program. It doesn't do much on its own other than the file and disk copying.

BTW: Is there any advantage of DOS2.0S over DOS1 other than the memory savings from having DUP as a separate program?

That's right, DOS 2.5 has almost hall of them. You could also do a
binary load from basic by opening the file, and then calling USR(5576) -
this worked for DOS 2.5 - not sure for 2.0.

I think you could also turn basic off with POKE 1016,1 before calling
the USR command, but I'm not sure if that is of much use in this case -
I think you might have to do something like USR(58484) (warm-start) to
make use of it.

One of the reasons Atari computers did so poorly was because they were a cross between a game machine and a business machine. The Apple II was so successfull because you could get an 80 column board for it, use it as a real business machine, and also a game machine. Also software developers took the Apple seriously, as well as the IBM PC. Using a TV screen is not anyones idea of a business machine.

I personally didn't want expansion boxes ad-nauseum just to install additional cards. Both the Apple II and the PC had the expansion within the case, instead of an external box. People obviously liked that.

The death nell for our company was Atari choosing to go through department stores (Sears, Ann & Hope etc.) for sales, instead of the thousands of computer dealers that were selling Ataris one month before... It was very difficult to get your producets in to these stores, plus, they really didn't have any expertise in the products, like the local computer stores did.

In my opinion why the PC beat out the MAC as the predominant computer of today is because the MACs were not expandable internally. Cute, but not expandable. The expandable MAC came too little too late, and was still way too proprietary. Whether people really need expandability or not, they psychologically really like to have it.

Actually, the 815 is controlled by a switch on the back that sets the
drive #'s as two consecutive #'s, ie. 1,2 or 3,4 and so on. I
think the way they described it was that with two 815 units, you would
have four logical drives (2 per unit) which had the capacity of eight
regular drives (ie. 810's).

I've used DOS 4. The file structure was similar to DOS 3, but incompatible
with it or any other DOS (it had utilities to read DOS 2 and DOS 3 disks).
Instead of allocating disk space by sectors or 1K blocks, it used blocks of
3 or 6 sectors, depending on the disk density. It supported single, enhanced,
double, and DSDD disks, but you couldn't switch from one density to another
in the same drive without going to the menu. There were two menu programs:
QDUP.SYS let you press a single key to run any .COM file, and DISKUTIL.COM
was similar to the DOS 2 DUP.SYS.

Believe it or not...

the Catweasel is a 8-bit card for PC (ISA).
with standard 3 1/2 and/or 5 1/4 floppy drives
can read all kinds of floppy formats.

Amiga - Atari - C64
Apple Mac (even 800k!) - Apple 2 - and some more..

have a look at the web-page:
http://www.rat.de/apd/catweasl.htm

If you have a floppy drive and disks of a format we haven't
covered yet ... we may need you to send it so we can teach
the catweasel even more tricks.

1524. RAM requirements for Atari 8-bit games?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-14 00:00:00 UTC
From: pbjurman@aol.com
Message-ID: <19980214045600.XAA04177@ladder02.news.aol.com>
Source record: 66033

I recently acquired some Atari 8-bit games on disk for my Atari 400. The problem is, I only have 32K RAM, and some of the games won't run. However, shouldn't all the older games like Defender, Moon Patrol, and Ms. Pac-Man run in 32K RAM? If so, then is it probably a disk error? Thanks.

>
>Well there you go.At least Commodore took a little after the Atari.But the

Yeah, right ;-). Note that the PET came out as the same time as the Atari,
and that the engineers had the VIC-20 experiences as well (in fact most of
the 64 kernal was adapted from the VIC-20, from the vectored routines to
the extra space in the error messages).

These really are two different things, and get at a philosophical difference
between the two machines.

There is something important to understand about the C64:

The designers didn't spend any time bothering with little 2% features that
most users wouldn't use (e.g. BASIC graphics commands) but instead separated
out and focused on the 98% issues.

At the same time, they made it possible for people to modify or extend
the system to suit their own needs, and documented everything in
considerable detail. Don't like the way we do stuff? Well, here's how
it all works, go ahead and change it!

Thus it is a very well-balanced machine, and very flexible. And for most
practical purposes it all works surprisingly well. It can adapt to new
technologies, and is very open to the programmer. There isn't a list of
rules you have to follow, and you don't have to fill out a form and stand
in line to get something done: you just do it.

It is also very practical for a machine with limited resources. And it is
this practical nature that underlies things like vectored routines.

For some C= history you may be interested in an article in the March 1985
issue of IEEE Spectrum.

>whole single byte access thing still bothers me.

There is indeed a "burst transfer" on the 64: "LOAD" and "SAVE".

>And no IOCTL capability. (i.e.no XIOs)

Sure there is. First you have to understand something about Commodore devices, though.

Commodore devices are "intelligent". The 1541 disk drive for instance has its own 6502, 2K of RAM, 16K of ROM, two 6522 I/O chips, etc. In general, any device-specific commands are implemented on the device itself. And there is always a way of sending commands to a device (on a disk drive there is a "command channel").

So, instead of typing

XIO 33 #1,0,0,"d:blah"

you'd use

@s0:blah or open 15,8,15,"s0:blah"

where the "s" stands for "scratch". Sometimes a shortcut will be added directly to BASIC (the OS if you like) itself. For example, C128 BASIC has commands like HEADER, which is a shortcut for open 15,8,15,"n:" (which formats a disk). But what you are doing is sending the command to the device itself, which then does something with it.

Other devices might have different or extra commands. For example, CMD drives have commands like CP (change partition) and CD (change directory). Any program which lets you send disk commands can then take advantage of the new commands (and hence new features). Thus an assembler which was written in 1985 can take advantage of a CMD drive that was built in 199x.

Note also that devices can be programmed. There are usually other channels as well, e.g. disk drives have a data communication channel.

To give you an example of the types of commands that are implemented on a device, here is a list of 1541 commands:

N New (format)
R Rename file
C Copy file
I Initialize
S Scratch
V Validate disk
B-R Block Read (read a sector)
B-W Block Write
B-A Block Allocate
B-F Block Free
B-P Buffer-pointer
USER1/2 Special version of B-R and B-W
Un User (jump to location in drive memory)
P Position

B-E Block-Execute (load block into drive RAM and run)
M-R Memory-Read
M-W Memory-Write
M-E Memory Execute

Note that these commands are separate from the normal OPEN GETIN etc.
commands.

>You need one of those RS232 cartridges.Speaking of which:how do term programmes
>use a MODEM connected to anything other than the user-port?
>Does it actually add a device number like you explained?
>OR do you have to have a term programme specially made for that type of
>non-user port interface?
>(I've always wondered!)

In general you program specifically for cartridge hardware like Swiftlink/
Turbo-232. You don't have to -- it is certainly feasible to extend
OPEN and CHROUT and whatnot. There's just very little point, so nobody
has ever bothered. Writing your own code is quite trivial (the ACIA has
three registers), is _much_ more efficient (like 115kps efficient
on a 128!), and there just isn't a demand to run outdated term programs
at high modem speeds.

If you want to see what's involved in programming an ACIA cartridge
take a look at C=Hacking issue #10.

>
>but what's an XIO? The ioctl() I know is in sections 2 and 5 of the HP/UX
>system manual :-), allowing nonblocking and asychronous I/O.

Remember that the Atari idea is "load the command, and then call the
device"* whereas the C64 kernal strategy is "load the device, and call
the command".

The normal CIO commands are things like GET, PUT, PRINT, etc. Any commands
above 13 are special commands, i.e. device-specific. So the disk device
has things like rename (command 32) format (254) etc. XIO is the
way of accessing these commands from BASIC (much like OPEN 15,8,15).

On the 64 this isn't part of the kernal, but is of course part of
the device.

>The 'RS232 cartridge' you refer to is the Turbo232, aka SwiftLink. Note that
>the Commodore user port is NOT a RS-232 port.

And the Turbo232 does not plug into the user port :). The ACIA signals
an interrupt when bytes are received, so it needs the cartridge port.

evetS-

* Actually it's "load the command, and the device, and the data, and the
other stuff, and call the CIO", but close enough.

1527. Re: RAM requirements for Atari 8-bit games?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-14 00:00:00 UTC
From: Fernando Ortiz <fernando.ortiz@mci2000.com>

Source record: 66036

Those games were originally cartridge games programmed to run in the 40-48k
ram area. When the cartridge was inserted in the Atari, the 40-48k of
memory was replaced with the ROM space of the cartridge.

Since you have those games on disk, you will need more RAM because they
must still load into the 40-48k RAM area.

To summarize, if you had those games on cartridge, then you could run them
on 16k machines. Since you have them on diskette, you need a full 48k RAM.

Gee... An apparent "SPAM"er using "die-spammer-die@127.0.0.1" as an (apparently) phoney e-mail address. What won't they think of next???

For the uninitiated IBM PC user:
a. "THE" floppy drive controller for max. disk drive compatibility (yes, that could have been worded better) was the Compati-Card (Sp???) by Micro Solutions (http://www.micro-solutions.com/), since discontinued but possibly still available used.
b. "THE" file conversion utility is Sybex's (http://www.sydex.com/) shareware (NOT FREEWARE but reasonably priced) "22DISK". It supports a large number of disk formats. A fully functioning copy is available from their web site (though the free version does not intrinsically support as many disk types as the registered version.
22DISK does not require a special controller to work though one may be needed depending upon the original disk type.

(Note: for everything but pure ASCII files, copying them off a non-IBM disk is only half the problem; you will then be left with having to find some way of accessing them!)

BTW the above is correct AFAIK!

Cordially,
Richard Kanarek

A bit of a hack really.. makes me wonder why a binary load/run option
wasn't included as an XIO call in DOS 2.5. After all DOS needs to
have the binary load code built in to load the files anyway, so the
extra overhead of adding the XIO interface is minimal. And if DOS 3
predates DOS 2.5, and DOS 3 had it...

From: velcro_spy@webtv.net
Message-ID: <6c4p3ufcp1@newsd-122.bryant.webtv.net>
Source record: 66046

For nostalgic reasons I recently picked up an Atari 800 system. I couldn't get the 410 cassette player to work and figured it was broken. So I purchased a 1010 (the newer cassette peripheral) but it won't work either.

Neither deck will play, or rewind or anything. I tried the CLOAD command and nothing happened. On the 1010 the light comes on when I plug in the power supply, but rewind/fast forward/whatever don't work at all. I am interchanging the standard atari power supply freely, do the cassette players take a different voltage than the disk-drive or 800?

Thanks in advance if anyone can help me.

What did you miss the boat? The point that he was trying to make is
that this plug in board for the PC would allow it to read non native
disk formats. IE... Apple / Commodore / Atari and such. Actually this
is good for alot of folks out there who have hugh hard drive and would
want to use it for storage. It sure beats the hell out of those darn
image files. I for one can think of many uses for it. Example direct
reading of my Atari ST disks when using the emulator PaCifiST

Cool, If you can get a good one at that price. I was assuming that he may of already tried to find one locally with no luck. The suppliers that I listed were an idea of where he could get such an item and what the prices for the said item would be. less shipping of course. I do assume that most people would look for a used one befor shelling out the $$$$ as you put it. But than again ?????? I wouldn't want to buy anything second hand that I couldn't make sure that was in working order. That to me would be a waste of time and money if it didn't work

The problem here is, CompatiCard (I think) and 22disk (that one's for sure) can read only standard MFM disks and, if you're lucky, FM. No GCR.

The catweasel card, on the other hand, can read everything that just uses a standard track distance, so except for some real oddballs like the Commodore SFD-1001 (which would store 1MB on a standard 360K disk using lots of evil, but relatively reliable, hacks.) it can (or could if you programmed it to) read everything, including Apple and Commodore GCR disks and the infamous constant-linear-velocity (?) Macintosh 800K disks, all in standard PC drives. Oh allright it might not work with 3" disks unless you can find a 3" drive with standard Shugart bus.

Linards Ticmanis

Richard> think of next???

Yes, that posting probably hurt Jens Schï¿½nefeld's Catweasel card more
than it advertised it. But on the other hand, also negative publicity
is publicity.

Richard> For the uninitiated IBM PC user: a. "THE" floppy drive
Richard> controller for max. disk drive compatibility (yes, that could
Richard> have been worded better) was the Compati-Card (Sp???) by
Richard> Micro Solutions (http://www.micro-solutions.com/), since
Richard> discontinued but possibly still available used.

Catweasel is a relatively new product, I think that the PC version
become available approximately one year ago. I don't have anything
else to do with it than that I met Jens Schï¿½nefeld in January 1997,
and he told me about the system.

Richard> b. "THE" file conversion utility is Sybex's
Richard> (http://www.sydex.com/) shareware (NOT FREEWARE but
Richard> reasonably priced) "22DISK". It supports a large number of
Richard> disk formats.

So does the floppy driver in the Linux kernel, and it is freely
available. You just have to use setfdprm to set the parameters for
unsupported MFM disk formats. E.g. the Commodore 1581 disk format can
be supported with the following parameters in /etc/fdprm:

cbm1581 1600 10 2 80 2 0x2A 0x02 0xDF 0x2E

Richard> (Note: for everything but pure ASCII files, copying them off
Richard> a non-IBM disk is only half the problem; you will then be
Richard> left with having to find some way of accessing them!)

True, and with Commodore machines you also have to convert text files
either from screencodes or from PETSCII to ASCII.

I have gathered some transfer solutions for Commodore 8-bitters on the
page <URL:http://www.hut.fi/Misc/cbm/xfer/>.

From: he110@cleveland.Freenet.Edu
Message-ID: <6c7buvpge1@alexander.INS.CWRU.Edu>
Source record: 65883

DOS 3? When I first got my 1050 (for Christmas, I paid half for
it), I booted DOS 3, read the manual, messed around with it
for a while, then got turned off and promptly went to a friend's
house for a copy of DOS 2.5... DOS 3 IMHO was really inefficient
in the way it used blocks instead of sectors. Of course, now,
for me it's either Sparta 3.2g or X, with DOS 2.5 only if I
ABSOLUTELY have to use it. What advantages were to be had in
DOS 3 over 2? DOS 2.5 was released when Atari realized that
few people really liked 3.

Whoops, then the fact that my 130XE is working must be an
illusion. A few months ago, I got tired of the grubby and dust-
filled state of my 130XE, so I cleaned the plastic case
(upper part) in warm water with dish washing liquid. I also
ran the keyboard (minus the circuit array and metal case)
under warm soapy water. I let them dry for a few days, put
it all together, and it was showroom clean again.

No problem.

>controller hardware.

Quite right, but this sidesteps the important point.

Remember that only the low-level routines like get sector, write sector,
etc. are in the Atari ROMs, so the ROMs are generally 2k-4k (or 8k if
you're feeling really brave) and there's like 256 bytes of RAM.

On the other hand, 64 devices have the entire DOS, and all the device
commands (like format and scratch and change directory), contained
entirely on the device ROMs (along with all the really low-level
routines). Each device has its own DOS, and adding a new hardware
device adds a new DOS automatically.

To think of it another way: the 64 can run a program while a disk is being
formatted or a file scratched. The drive is doing the work, not the
main computer.

This scheme has its advantages and disadvantages, of course.

Now, some programs (e.g. GEOS, some fastloading or copy-protection
schemes, etc.) will reprogram a device to use a custom file (or even
disk) format, and so act more like an Atari DOS.

Found an atari 8 bit game system at a thrift store. It's the 130 XE game system,
with externally attachable keyboard and a power supply, but no cartridges.
What is it worth? I pick it up about $20 canadian. If anyone wants it,
let me know.

1566. Re: DOS 3 buggy? Well, no.

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-15 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6c8pnn$b2m$1@newsd-199.bryant.webtv.net>
Source record: 65898

Incompatible? No, all the programs that I wrote, typed in from Antic and COMPUTE! all worked.

Incompatible with DOS 2? No, I just did a *.* conversion and went from 88k to 127k, or 130k without the FMS.SYS. Gained at least 39k per disk without having to buy another DOS.

Slow? How? With a 6502 running at less than 2 MHz, it loaded programs as fast as 2.0 ever did, and since I always altered the INIT values when I formatted another system disk, it certainly wrote to the disk faster.

Ah, slow to those who could not understand, or even try to understand how DOS 3 worked... Or since the user interface was different, and people being unwilling to learn, staying within their "comfort zone", well yes, I would suppose it would be slow to them.

Clunky? Well, if one went to BASIC, then realized there was something they had to do with the DOS menu, when you typed "DOS", DOS 3 did not have to reload the DUP.SYS, the menu popped up instantly. You didn't even need to load DOS to format disks, a simple BASIC command, or a short three line or so program would do it for you.

I always wondered what the rationale was, opposing DOS 3, but I suppose I mentioned a few already.

I'm not here to advocate DOS 3 over any other DOS (comp.sys.atari.dos3.advocacy? comp.sys.atari.dos3.die.die.die? heh heh), but to stimulate conversation.

1567. Microsoft BASIC- incompatible

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-15 00:00:00 UTC

Message-ID: <6c8r90$b5p$1@newsd-199.bryant.webtv.net>
Source record: 65899

I liked having the extra commands that Atari BASIC did not, but once you write programs, no one else could use them, unless they also had Microsoft BASIC. What a drag. There was no run-time program for it, you could compile it, but that was a drag, too.

Interesting to have, but of limited usefulness.

Message-ID: <34E68CA6.3520@prodigy.net>
Source record: 66063

Greetings to all fellow Atari 8-bit users,
Does anyone have a suggestion how to convert some old Compuserve-type
"XMO" files to the corresponding ATASCII format? I purchased the
XFORMER CD-ROM disk last year and I found several files that were
archived from the old Compuserve Atari Forum (from early-mid 80's ?).

Is there some simple binary-load or BASIC program that will convert
these to a useable form?

Thanks for your help,
Doug Feldman, in Ann Arbor, MI

1573. WTB: Disk Drive for my Atari 800

From: Otter <otter@oz.net>
Message-ID: <18743.otter@oz.net>
Source record: 66065

Oops. I must have looked at the headers wrong. I thought I had
emailed the original poster... Anyway, I went ahead and picked up
that power supply today. It works fine, and it was only $1.00 If he
has already found another one elsewhere, that's okay. I can always
use more power supplies as my collection of "stuff" grows...
Something else I bring home frequently are Atari SIO cables. I keep
hearing about how hard they are to find, but there seems to be an
abundance of them here, so I grab them just in case anyone might be
interested... (I do the same with Commodore serial cables as well...)

I hate to be argumentative, but BobTerm will strip off any extra characters if I remember right, and I have yet to see any file, Basic or Binary, which wouldn't run just fine even with the added bytes, with the exception of if someone was using Sparta-Dos. The Binary files contain the length of each segment within the file, so any program which is using a good loader, shouldn't have any problem, and a simple Basic Load command will load any basic files too.

> the june 1988 antic and I could not see any. What an I missing?

The XF551 was made by Atari and is relatively poorly constructed.
The Indus was made by Indus and has a reputation for being reliable.

The XF551 is double sided, double density.
The Indus is single sided, double density.

They use different schemes for high-speed operation that are mutually
incompatible and that are incompatible with the USpeed Doubler for
1050 drives.

I forget which DOSes support the high-speed mode for the XF551. (that
late Atari DOS whose name I forget --- DOS XE?, some SpartaDOSes, I
forget which). On the Indus you're pretty much stuck with DOS XL and
SpartaDOS X. Bob Puff of CSS has a ROM upgrade for the XF551 that
fixes some bugs it has and gives it USpeed compatibility.

Source record: 66068

Whoops.... Did someone get some cracked games??? As I remember, the games were on cartridges, and the computer did not need the "extra" RAM...

In any case, it would probably be cheaper to find an old 800 or 800XL than to try to find a memory upgrade for a computer that is almost 20 years old.

1578. Atari 815 dual disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-15 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6c6ak3$92v$1@newsd-199.bryant.webtv.net>
Source record: 66069

The Atari 815 WAS released, but was discontinued almost as soon as it came out. In the days when 810 drives were $500, spending over $1000 for an 815 was almost ludicrous.

Atari had DOS 2.0D for the drives, they were double density (hence the "D").

Back then, it was planned that you could connect four 815 drives, and there were switches on them that could configure up to eight individual drives (D1: to D8:)

By the way, DOS 3 also had support for eight drives- that is why I think the XLD drives were to be D1: on one side and D2: on the other. So, four XLD drives would make eight individual devices.

Now it just kills me that I had an 815 within my grasp, and I couldn't snag it!!! A friend was running an Atari Service Center, and he had one on his bench. When he closed his shop, I kept bugging him if I could have it, but he said it was in some box somewhere. Well, he never did find it. Rats!

On 20 Jan 1998 Bostone1 (bostone1 att aol dott com) said:
->> The masses were never interested in BASIC any more than they
->> are interested in getting under the hood of the car.

That's especially true in the Yuppie Age!

But then, on 10 Feb 1998, D. Klugh (dklugh att iwaynet dott net)
posted this reply to Bostone1:
->And hence we have WINDOWS! <sneer>

Even in the heyday of the 8-bits in the early to mid-80s, when
there were hundreds of thousands of Atari 8-bitters who *were*
using BASIC, most of them were gung-ho on using lazyloaders. It
was obvious that something like Windoze was inevitable and would
be a big success. When somebody puts out computers like those on
the Startrek TV shows, which you only have to talk to and which
do everything for you from flying spaceships to creating your food
for you, they too will sell like hotcakes and make all older
operating systems obsolete.

->I still can't believe that people can't set their VCR clock or
->programme it. I just always take it as "urban legend".

No, it's not legend; it's true. There are still many people
like that out there. Nowadays they're saved from the ignominy
of flashing clocks because of automatic VCR programming and the
elimination of the flashing displays by the manufacturers. But
there've been times when I've come across flashing displays and
reset them -- feeling like a "Spock" or "Data" character from
Star Trek, applying the principles used by one brand (or civili-
zation!?) to another one ("Can you figure out the aliens' system?"
Kirk/Picard says to Spock/Data. "I think so, Captain! Their
markings are similar to those on the Planet Panasonic!"). When
you do that, the people who don't have a clue think you're a
magician.

->Interesting, any one know why that might be?

This trick was mentioned in the Atari magazines back in the
'80s as a way of salvaging a disk that had become unformattable
with one of the regular DOSes. I tried it once but gave up on
the idea when the clunky, slow DOS 3 just about burned up the
drive. Disks are cheap. It's not worth tearing up a good disk
drive to save a disk worth five cents (or less).

On Thu, 12 Feb 1998, Mark Newton-John (marknewtonjohn att webtv dott net) wrote:
->... people have said that DOS 3 is buggy. But no one has ever ->been able to tell me what those bugs are.

The issue wasn't that Dos 3 was buggy; it was that Dos 3 was *not* compatible with what had become the standard, namely Dos 2.0s (the "s" standing for single density). This was meaningful at a time when there were large numbers of Atari 8-bitters, and they had no interest in copying their entire disk collections to disks formatted with a different DOS which was 1) incompatible; 2) slow and clunky; 3) organized strangely at best, clumsily and badly at worst; and 4) which offered no advantages to overcome these negatives.

Compatibility with Atari Dos 2.0s mattered back in the '80s, just as compatibility with Windoze matters today. Back then there were thousands of 8-bitters in organized Atari circles in every city, either as members of clubs, modemers registered with BBSes, subscribers to magazines, or friends and associates of those who were. Clubs had disk libraries, and magazines had type-in and other programs available on disk. There was overwhelming reason for having a "standard" DOS used by everybody. An incompatible DOS was as out of place as an automobile with square tires.

Today, on the other hand, at a time when in my city, for example, there's one active 8-bitter for approximately each one million people, it doesn't matter anymore. If you want to use DOS 3, you're free to do so. But if you pick up somebody's old 500-disk collection for a song at some flea market, you may regret not having switched to a DOS 2.0-compatible a decade ago!

Hi!

I'm looking for a menu program that would allow me to write full program names
for files I want to load.
I do have Speed Start Initializer and NDOS, but these won't let you do certain
things;
in the case of a graphics viewer asking you for the directory, for example,
you'll get nowhere...
I believe this has to do with the boot procedure; neither uses DOS.
There was a program called Master Program Directory (Barteck Software) in 1984
(see page 97 of Antic's July issue) that would let you autorun your programs
while displaying full titles; anybody have it?

Thanks for any help!

1593. Ack! Darn the luck!

I went to the local thrift today to try to find an Atari 800xl (I'm looking for an Atari 800 or 800xl with at least 48K RAM) and I found a box with a black box that appeared to be an Atari computer power supply. Could it be? I opened the box more, and a keyboard appeared...it looked like one of the newer Atari computers if it was one at all. Then I looked at the nameplate, and it said "TI-99/4A". What a disappointment! I like the TI-99/4A but I am not looking for one...oh well, maybe I'll find what I'm looking for soon.

>
>Hmm, okay, call me stupid, but how do these differ from each other then?
>It seems like the same thing is going on (but just in a different calling
>convention).

They are similar. Remember that to do I/O on the Atari you fill out a
form and send it to the CIO, which then processes it. XIO lets you
call _all_ CIO functions directly, including standard functions like OPEN
(XIO 3 #1,0,0,"D:BLAH" -- 3 is the CIO "OPEN" command).

The other main difference is that on the 64 commands like scratch are
performed by the device itself; the Atari has no DOS until you load it
into the computer off a boot disk. PRINT #15 sends commands to the
disk drive; XIO sends commands to the DOS (the CIO really).

Finally, XIO is really a BASIC command; OPEN is a 64 kernal command.
You wouldn't use XIO from an ML program.

From a user perspective, though, there just ain't much of a difference.

I recently got the H: device going on xl-it. I just made one directory
in my xl-it directory. I noticed the following using atari DOS 2.5
Only files with an extension showed up in the directory!
ie bluemax was "invivible" but blue.max showed up?
Also has anyone written a file loader for the H: device, sort of like
yogi's loader for his mega 1MB disk images? That would be really handy!
All your file games in one directory, cool!

He may be partially right, on my 600xld, using Dos 3, you can make it think it is 2 drives, one on each side, or it will also act as a regular DS/DD drive. If the 1450 drives were the same, they may do both as well. Some of the Astra drives could work this way too as I recall...

Actually it would only need HATABS if you wanted other programs to be able to access it. If it is program specific, such as my MiGraph scanner software, which isn't designed for use by anything else, the device table for it actually resdies within the program.

All of the ccommands are available in all of the Atari Dos's
as far as I know, they are a part of the Dos itself rather
than the Dup part. The DUP.SYS is merely a menu driven
interface to the Dos commands, and all can be executed
independently. (If the Dos supports the command, like no ED
format in Dos 2.0s...)

> anyones idea of a business machine.

The TV screen was seen by many, myself included as an added feature, and to this day, even though I use monitors on my Atari's, my TV is directly above them, so that I can watch it when I'm not working.

Atari wasn't short on software developers either. The problem was that Tramiel had a nasty habit of alienating them, so they moved on to other platforms. There were many excellent business programs available, many of which I still support today, and businesses are still running to this day.

As for a cross between a game machine and a business machine, until the internet came along, the main reason people had home PC's was still to play games.

> I personally didn't want expansion boxes ad-nauseum just
to install

liked that.

It is very easy to make an Atari look like a clone wiith an Atari keyboard. I have several systems with everything mounted in a flip-top PC-XT case. The fact is that it is a very expandable system, and that is preferrable.

> The death nell for our company was Atari choosing to go

Actually that wasn't much of a problem either. The problem
was Tramiel thought he could blackmail the loyal Atarian's
into buying an ST, and he quickly found out that we weren't
the sheep he thought we were. Other than that, lack of
marketing of any kind is what hurt the most. The ST lost
most of it's credibility on the open market when it came out
and there wasn't sufficient software to support it.

> In my opinion why the PC beat out the MAC as the

> darkroom@ix.netcom.com

Again, the Atari IS extremely expandable, and it CAN all be
placed in an IBM style case. The reason Atari didn't win
the battle is because of short sightedness, greediness, and
lack of marketing, together which made for an insurmountable
problem.

As a general rule the .XMO extender meant only that is was sent via X-Modem. If you are using a real Atari, you could just try using a RUN, or ENTER command, if those fail, try a Binary Load. If all else fails, load them into TextPro and look at the actual file to determine what it is. If it starts out with two chr$(255)'s, then it's a Binary/Object/COM file. Anyway, most shouldn't need any conversion at all if they weren't compressed.

If they were compressed, or maybe just plain the easiest way for you, would be to run WHATIS on them. This should tell you the file type, and if it is a compressed file, hopefully what compression method was used. If you don't have access to a WHATIS program you can run, let me know and I can send you one in Atari Basic attached to an E-Mail.

The Shadow

PS: In case you're interested, this WHATIS program I'm referring to is the same one I wrote for Carina BBS, and it will work on nearly ALL types of files, not just Atari files, and it will list the contents of compressed files as well.

No, the SC1224 is an Atari ST Color Monitor. A good choice
for the 8-Bit would be either a Magnavox, Nec, or Commodore
1702, 1802, or 1902. The C= ones ae probably the easiest
and cheapest to find.

That may well be true, but considering the possible life span difference between a NEW one, vs. the unknowing lifespan of a used one, the new one could be much cheaper in the long run.

From: rldetlefsen@delphi.com
Message-ID: <xLeEW01.rldetlefsen@delphi.com>
Source record: 65916

Actually, since the system already has 32K in it, all that is needed is another 16K ram card, and those are not hard to find. For a 400, then a more special 48K or 64K card is needed. And instructions for several upgrades are available.

Where is U26? With the board setup so the 16 ram chips are to the LEFT, U26 is the front most chip of the second(inside row). U27 to U33 follow in the row to the rear of the board. When removing these chips, be extremely careful. Atari put all of the really fine traces on top.

So if I understood that right, DOS 3 manages to format the disk because
it just keeps on repeating the format until either it succeeds or you
stop it, where as other DOS's will only try to format a disk a limited
number of times (i.e. twice in MyDOS) before giving up and returning
an error.

One HUGE problem (bug, feature, whatever you choose to call it) was the fact that once you created a DOS 3 disk, it didn't matter if you had a D/S D/D drive or any other drive you couldn't read that disk using any other DOS, even on a 1050 drive booted up with DOS 2.5 or My Dos, SpartaDOS, it didn't matter, there was a conversion utility I can't remember the name something like d3conv2 or something that would convert files back but it was a nuisance and not worth the time or trouble. Actually Atari did have a couple of dealer announcements for a Double Desnity 1050 along side with the Enhanced Density 1050, why they opted for 127K while everyone else was having no problems selling 180K drives it beyond me, it was a waste of time and money.

1616. 8-Bit game programmers - Check this!

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-16 00:00:00 UTC
From: Larry Serflaten <serflaten@mail.usinternet.com>
Message-ID: <34E85340.795C@mail.usinternet.com>
Source record: 65925
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.8bit

Are you still programming your old 8-bit? Do you specialize in
writing games?

Lots of people (well, say several at least) still want new software
for their old Atari 8-bit (400-800 XL/XE) computer systems. A certain
national distributor I know (Video 61 / Atari Sales) wants to fashon
cartridge games from new software. His deal with me is (X amount) per
cartridge which he pays when he makes them up. No, Im not getting
rich, but I do have a place to go to get some cash, while helping
the Atari community (who else will?)

I have to supply the software formatted for his E-Prom burner (not
difficult) along with the instructions on how to play. He gets to
decide how many to make (usually 6 at a time) and sells them to his
customers.

If you can write games that are 16K or less, and want to get in on this
action, click on the link below (or reply E-mail) for more information.

By the way, games may sell better, but anything that would be useful
on a cartridge might be acceptable!!!

Again, THIS IS NOT A GET RICH QUICK SCHEME (scam) :)

What I plan to do is to compile a list of interested parties, (by
about March 13th) then send him the list. He indicated he wanted more
programmers, so he may contact you. Note, he is already very
busy answering the phone for orders and such so that I wont post his
voice number here, his BBS # is (612) 462-3680 (BBS Express Pro).

You are probably indundated with e-mails from our Atarian colleagues,
but here's my 2cents (for what is it worth)

Bottom line, Indus GT, nice sleek, smaller than 1050 5.25 floppy drive.
REAL Double density 180k/side, not cheap enhanced 1050 density.
With appropriate software you can use GT Synchromesh (comparable to a US
doubled 1050). I think SDX allows this Synchromesh

Xf551, (my personal fav 8bit drive, so I am horribly biased)
TRUE DS/DD (ie 360k per disk, without flipping), sleek XE-grey drive,
built in ultraspeed, accessible via Black box, SDX or other equivalent
methods. (not as fast as other speed increased, but fast never the
less).... I have had it since 1988... no problems..good drives for BBS
backups (in the olden days)
I would like to own both actually..

barnyard blaster (the XE light gun game) had pretty decent grafx (came out
in 1987 I beleive). Agreed the game play was monotonous and boring after
the initial "thrill" of shooting wore off.

Still have the Xe light gun, barnyard blaster, crossbow (VERY NICE!),
crime busters and bug hunt.

From: Albert Yarusso <ay@ionstorm.com>
Message-ID: <6ca2dcirc1@news.onramp.net>
Source record: 65936

Long ago, I had tons of Atari 8-bit stuff, most of which I was using to run a large BBS (Phantasmal Alchemy, in Connecticut).. The BBS hardware consisted of Atari 800XL w/256K, SpartaDos X, ICD RealTime Clock, Basic Rev. C, 1MB MIO Board, Adaptec HD Controller board (don't remember model), two Seagate ST225N 20MB HDs, Atari XEP80, two Happy 1050s, two Indus GTs, Commodore 1702, some monochrome monitor (for the XEP), various modems (Avatex, Zoom, USR) and other stuff that escapes me right now.

I'm trying to put together a similar system again and am interested in finding any of the above hardware in working condition. Especially items like the MIO Board and SpartaDOS X, because I'd really like to hook hard drives up to the 8-bit. I'm also looking for other misc. 8-bit hardware and software, and even ST stuff if you have some.. So if you have anything you'd like to part with, please drop me a line..

Thanks!

..Albert Yarusso, ay@ionstorm.com

Source record: 65939

Of course. You will need a couple of things to make the connection.
1. you will need the PBA for the cartridge port. This takes the cartridge port and the enhanced port on the back of the 130 and combines them into a port that is the same as the 800XL. this is of course if you are running a MIO or K-Products interface only
2. you will need either a Black Box - a MIO - or a k-Products interface. This is where you will find your SCSI connection.
3. you will need a controller card if you use any ST-506 compatable hard drives outherwise you will need a scsi hard drive. You will have to find out which ones are supported by the maker of the interface that you choose to us. I do beleive that K-Products (the old Supra interface) is a SASI unit and will require a SASI interface and an older type MFM hard drive. SCSI (Small Systems Computer Interface)and SASI (Shugart Assoicates System Interface) controllers are NOT compatable.
4. some formatting software. This is usally provided be the makers of the hard disk interface.
5. You will need a DOS than can handle large capacity drives ie. SpartaDos/ MyDos etc.

Actually hooking up a hard disk to your 130XE is simple. Hope that this help you out. If you have any other questions about your computer and connecting a harddisk to it feel free to e-mail me.

I just aquired an 800XL, 1050 drive, various other hardware, software,
carts,
etc., but am lacking documentation.

Anyone know of of any sites or vendors where I can get game manuals,
etc.

Thanks.

Ron

We used to have a guy who did preventative maintenance on disk drives
(XF4551s, 1050s, etc.) One of the things he did was to wash out the cases.
I thought that was a nice touch.

Price-$8.00

19. Jewels of Darkness / Original Disk, manual and box.
Price-$6.00

20. Damocles / Original Disk, manual and box.
Price-$7.00

21. The Sentry / Original Disk, manual and box.
Price-$6.00

22. Q-Ball / Original Disk, manual and folder box.
Price-$7.00

23. Mortville Manor / Original Disks, manual and folder box.
Price-$7.00

24. Into the Eagles Nest / Original Disk, manual and folder box.
Price-$6.00

25. Cloud Kingdoms / Original disk, Poster instructions and box.
Price-$7.00

26. Monster Pack Volume 1 (includes 3 games)
Shadow of the Beast 1.
Infestation.
Nitro.
All original disks, manual covering all games, and box.
Price-$10.00

27. Zork II / Original disk, manual, box, and etc.
Price-$6.00

30. Beyond Zork / Original disk, manual, box, and etc.
Price-$7.00

31. A Mind Forever Voyaging / Original disk, manual, box and etc.
Price-$7.00

33. SpellBreaker / Original disk, manual, box and etc.
Price-$8.00

34. Perry Mason
The Case of the Mandarin Murder / Original disks, manual and box.
Price-$7.00

35. High Roller / Original disks, manual and box.
Price-$7.00

Atari ST Applications and Utilities

A1. Easy Draw Package
SuperCharged Easy-Draw version 2.24.
Super Charger version 1.01.
Easy Draw Font Pack 1.
Easy Draw Personal Draw-Art 1.
All Original Disks and Manuals in the Original NoteBook.
Price-$15.00

A2. Partner ST / Original Disks and NoteBook Manual.
Price-$8.00

A3. PayRoll Master / Original Disk and NoteBook Manual.
Price-$7.00

A4. Scholastic Series Biology Package
For Grades 8-9

Volume 1 Original disks, manual, and plastic folder box.
Volume 2 Original disks, manual, and plastic folder box.
Volume 3 Original disks, manual, and plastic folder box.
Volume 4 Original disks, manual, and plastic folder box.
Price-$12.00

A5. Photo Show Plus version 1.01 / Original disks, and manual.
Price-$6.00

A6. Slicctop / Original disks and manual.
Price-$9.00

A7. Michtron Package
The Juggler / Original disk, manual, and box.
Michtron Utilities / Original disk and manual.
M-Cache / Original disk and manual.
Tune Up! / Original disk and manual.
PinBall Factory / Original disk and manual.
Price-$15.00

A8. Metacomo Make / Original disk, manual and box.
Price-$5.00

A9. Quick ST II version 2.21 / Original disk and manual.
Price-$5.00

A10. PaintWorks version 1.5 / Original disk, manual and reference card.
Price-$7.00

A11. AutoProgram database / Original disk, manual and container.
Price-$5.00

A12. HelpMate / Original disk and manual.
Price-$7.00

A13. Abbreviator ST version 1.1 / Original disk and manual.
Price-$5.00

A14. AND Fast-Key Shell / Original disk and manual.
Price-$6.00

A15. AND Cash_Register / Original disk and manual.
Price-$6.00

A16. ZoomRacks / Original disk and manual.
Price-$6.00

A17. Thunder! version 1.31 / Original disk and manual.
Price-$6.00

A18. ColorWriter version 1.2 / Original disk and manual.
Price-$5.00

End of list.

1637. Atari 800XL For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-16 00:00:00 UTC
From: johnskis@earthlink.net
Message-ID: <johnskis-ya02408000R1602982015290001@news.earthlink.net>
Source record: 65946

It's been so long, I hope I remember all the stuff I have!!!!

800XL loaded to the gills with ram
Dot Matrix Printer
Ton's & Tons of software
40 Meg HD
Black Box
Joy Sticks
13 maybe 14 inch color monitor can't remember which
All manuals and most docs
etc......many more things I'm sure I don't remember

Prefer to sell in the Buffalo, NY area as you will have to pick up.....

My wife is bugging me to get rid of it, make an offer for the whole shot. I don't really want to break this up. I would prefer to sell as a package.

John Chmielewski

1638. ATARI Equipment MUST SELL

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-16 00:00:00 UTC
From: terry ortman <Use-Author-Address-Header@[127.1]>
Message-ID: <19980216.200059.4567.1.ortman3@juno.com>
Source record: 65947

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $50.00 or best offer. These SELL AT Video 61 for $49.95 used.

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them. Again, these sell, each $49.95 at Video 61.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes power supply, original cost $179.95, asking $75.00. These sell at Video 61 for $74.95, same price.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks, valued at $25.00 each. Asking $250.00 for the entire package. These are not currently available anywhere else that I know of.

ATARI 800XL upgraded to 256K memory, will run most 130XE specific programs, already wired for Turbo-816 installation, just need to re-solder 3 jumpers, and plug in the Turbo-816 kit above. Original cost $189.95 for the 800XL, $79.95 for the Upgrade kit, $65.00 for the 256K DRAMs, asking $125.00. Video 61 sells the USED 64K model for $59.95.

Supra External 2400 Baud Modem, includes powewr supply, no manual, Hayes Compatible, requires 850/P:R:/ATR8000, asking $30.00

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Will consider trading for a trak AT-D4 double sided disk drive NEED ONE
BADLY someone has to have one, or a trak double-sided slave drive.
MAKE OFFERS!!

PS you message was a bit hard to read. The lines are a bit long and I don't know how to tell NetScape how to show me everything.�
And saving the message to disk sdidn't help either. It just chopped of the last words of every line.

PPS Anybody know if the Tramiels ever made an Atari product that had a case that'll hold a 5.25" and a 3.5" drive mech. (and an HD inside).
I lie the look of the Mega ST's and the harddrives and such. They look a bit like the XE. And a lot better than most PC towers.

hi,

i am not sure if i have the right thing for you. but have a look at my
atari pages, in the 'demos-section'. you can find there a menu loader
which is using a DESCRIPT.ION file for the long names. grab some info on
those pages.

bye, sven.

>plenty for most users- (24 Mb was huge back then in 1978)
>
>Anyway, remember-
>
>DS/DD disks. Not HD, especially not ED. And notch those disks to format
>the back sides.

The ED folks are talking about here is Enhanced, Medium, Dual density. It used 128 byte sectors, like Single density but MFM (this is a methode to record
data on a disk (floppy, hard) just like Double density. Some folks (especially ATARI themselves) called Medium density "Double Density". The ED you're refering
is something totally different. HD floppies have a maximum of 1.44 MB, while ED floppies (look the same) will max out at 2.88 MB. The "Atari 8
bit kinda" ED format gets you approximately (sp?) 130 KILObytes.

>Bob

I guess because they where not available or too expensive.
He says he has the logic, but it still didn't work. If you wanna ask him yourself, here's his address 76702.1076@compuserve.com

My schematics (some bad copy of some manual, I guess it's ATARI's service manual) mentions a
74ls958 which you need when using a PAL instead of a co 25953. Maybe he didn't use that one.
It might be hard to find, because it's in none of the catalogs I looked at.

CU Mathy Van Nisselroy

PS XL PAL doesn't spell XE PAL does it??? :-)

That same light gun was also sold by Actionware(?) for games
on the Amiga (a long time ago). (It has the Atari logo on the
plug.) The Capone game they had was much easier to play with
the light gun than with the mouse. I'm not sure if they had
any more Amiga games that used the light gun.

Yes I do agree that cleaning out the case is a nice touch. But one should be careful on telling someone to hold the keyboard under warm running water. I read this to mean the keyboard not the case striped down. One should never assume that the reader will make the connection. Just a thought.

Alan Sharkis wrote:

> We used to have a guy who did preventative maintenance on disk drives

Source record: 65970

Hi, folks... good news: I recently found a MIDI player for the PC that
plays the files through the speaker, and it included C and assembly
source code! So now, together with the MIDI docs, I think I've got
enough material to start working on a MIDI player for our beloved
ATARI 8-bit computers... if I find the time (yes, I know I've promised
it REALLY LONG ago...)
That PC program, of course, plays only one channel of the 16... but
it lets you specify WHICH one. I think our ATARIs (with 4 voices)
will definitely sound much better...

>->I have been thinking about building a power supply ... If I get
>->enough feedback I will see what they can be built for.
>

You could always try this...

Take a ventilated box of the appropriate size, and mount a power strip (surge protected, of course!) inside, with the plug and cord leading outside. Then put the power supplies for each piece of your equipment inside the box, and plug them into the power strip. Label each of the equipment power leads, run them out through 1 or 2 holes in the box, and take great care to connect to the proper pieces of equipment. Plug in the power strip, and you're in business!

Crude, but it'll get the job done, and it's cheap. Fewer cables, less tangle - isn't that what you were looking for?

>lots of evil, but relatively reliable, hacks.)

The "hack" which makes this format unreadable for today's floppy drives and thus for Catweasel, is that it used a different floppy drive, which differed in its physical track density. It used 100 tracks per inch instead of the 96 tpi used by other drives. So you can read one or the other track, but other drives are physically unable to locate many of the existing tracks.

1666. Runtime Error

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-17 00:00:00 UTC
From: sysop.fox-1@stackbbs.xs4all.nl
Message-ID: <888018652@stackbbs.xs4all.nl>
Source record: 65975

Last week I gave APE 1.16D a try...

A few questions:

Savings to image's are giving very weird results with the
Highspeed-mode-feature of my Black-Box enabled...
I configured APE to 2*SIO since 3*SIO doesn't work anyway with the
unregistered version.

Sometimes I get a Runtime-ERROR 103 at 0000:198D, and will be throwed to
the commandline...

The APETIME.COM is working, but only when used with the 3.2G version.
Since I run a BBS which must be used with version X3.3a or X3.3b, how can
I patch ApeTime to let it work with these versions ?
In the code I saw you did a Sparta-Dos version-check for 3.2, but what
does it suppose to do when another DOS is used ? I got a message saying:
Download-Faillure or something...

The setup I'm using:

AT 386SX 40 Mhz, 2Mb,
VGA 256Kb,
MFM harddrives at Cashed controller,
SCSI harddrive at Adaptec 1542CZ controller,
MS-DOS 6.22NL,
SIO2PC One-Chip interface (7400LS),
Atari 130XE,
Some 1050's w/ Happy/Speedy etc.
Some XF551 40/80 tracks,
CSS Black-Box.

A whole other question:

Is it possible to configurate APE to use the modem thru a non- R: device ?
I mean, the Black-Box has it's own resident R: handler, and no matter what
device-number for R: is choosen, it's always communicating with the one on
the Black-Box.
In the past I was thinking to make a patch for the Atari 850 interface, to
burn another EPROM which uses M: as device in stead of the standard R:.
This way I maybe can connect multiple serial RS232 devices to the same
Atari and using them at the same time.
Of course not any terminal or something will support this feature,
however, I think there are some drivers for modems directly connected to
the Atari SIO-con. which uses also M: as device. But since I wrote my own
little terminal using MAC/65, it isn't a big task to replace the R: with
M:...

Message-ID: <34EAF828.9939FB26@erols.comX>
Source record: 65833

Well,

Since someone had to bring it up. During the early 80's it was well known that Atari had better quality control on their items vs C=. I worked at a Sears store that sold C64's and 1541 drives. We had to sent back ALOT of 1541 drives(in fact we had to ship a complete batch of 30 back once). They were painfully slow but some 3rd party products sped things up.

I have 4 1050 drives(1 with a Happy enhancement) and all work fine today. I had an 810 drive that ran great for 10 years but in now out of alignment.

Atari's big problem was with software development. Anyone remember DOS 3.0?

That's cool. but even with vents think about the heat that will be created with all them power supplies in the same unit. I would prefer tho have a single power source that had many different voltages from the same unit and would have power to spare for any future additions that one might add. Most power supplies that come with your unit are just fine to supply it, but what happens when you make a modification to the unit. Such as adding memory to a 130XE. In most cases you may slide by with a stock power supply, but you are courting failure, by increasing its load. The problem they were designed in most cases to supply just enough power to computer itself. I can tell you from experience that a 130 power supply will quickly fail if you upgrade the memory stock to the 1088K (1 meg) upgrade. Even doing a 576L (1/2 meg) is pushing it.

1669. Anybody completed Zeppelin?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-18 00:00:00 UTC
From: Anders Skelander <Anders.Skelander@uab.ericsson.se>
Message-ID: <34EB12CE.1805@uab.ericsson.se>
Source record: 65835

I remember Synapse Software's Zeppelin game as a
a very impressive item from the early 80s Atari
400/800/XL gaming world. It was probably the first
>16K game I owned.

I really enjoyed playing the first level and the
beginning of the second one, where I always failed.

Has anybody completed the game? How many levels are
there? Are there new types of enemies or backgrounds
in level two or later?

Anders

>processors 8k ram and many other things. Atari didn't even exist at that time.
>So who's copying who? :)

A brief Atari timeline:

1972 Atari Inc. formed (think 'Pong') (incorporated on June 27)
1977 Atari releases VCS (Atari 2600)
1978 400 and 800 announced
1979 400 and 800 debut at January CES, start shipping in November
1981 GTIA chip (more colors, new graphics modes)
1982 1200XL released (64k, etc.)

And, a brief Commodore computer chronology:

1975 65xx chips by Rockwell and MOS
1976 Commodore takes over MOS
1977 KIM
1978 2001-8 8K RAM, built-in casette, small keyboard, small white monitor
1979 2001-16, 2001-32 16/32K RAM, large keyboard, no casette
2040 disk drives (DOS 1, SEQ files only)
3040 disk drives (Shugart, DOS 1.2)
6510 processor developed
1980 4008, 4016, 4032, 8032 -- more ram, 80 columns, etc.
4040 disk drives (DOS 2.1, relative files, etc.)
8050 disk drives (DOS 2.5, Micropolis)
1981 4008, 4016, 4032 -- bigger screen (12" instead of 8")
VIC-20 (22 columns, etc.)
MMF (extra memory, 6502/6809, RS232, etc.)
C= begins design of 5um graphics chip to make "the world's best video game"
in January; finished in November.
1982 C64 debuts at Januray CES ("All we saw at our booth were Atari people

with their mouths dropping open, saying, 'How can you do that for
$595?'")
C64 design finalized and begins volume shipping in August 1982

So, not quite first. In fact, last. Clearly, Commodore had nothing to
even compare with the Atari computers, let alone beat them, until the 64
(although the PETs have a lot of nice software, and other features).

> Oh and Atari mechanics are very poor quality.

Not like those super-reliable never-fail 64 disk drives, eh? :)

Well, Atari must have existed in 76-77, since they released Pong in 72 (???) or so! And Atari's chipset isn't a copy of PET, more like Amiga chips beeing copies of Antic (Created by the same man I think, Jay Miner (???))

And most importantly Atari's has soul, Commodore's are just ... decent computers, but not great as Atari computers are. I love all my Atari's and always will. Take Atarian care

> the only one who has original "good as new" Atari equipment either!

It was of course a silly statement. Lots of both kinds of drives are still
around, and working fine.

Some will also point out quality control -- C= had pretty slack quality
control for many years. The 1541 itself is a tank, but has a problem
with heat (which leads to misalignment) and has a cheap-ass full-wave
rectifier on it which can blow (too low of a power rating).

> Hmm...thought I read in several (early) mags. that the Commodore 8-Bit drives
> were notoriously unreliable and S-L-O-W... ;-)

Not unreliable, but they are dog slow. This was the one area where marketing
was allowed to make design input -- they insisted on compatibility with
the VIC-20.

When the VIC-20 was designed, though, there was a small bug in the 6522 I/O
chip they were using. The net effect was that instead of being a "byte
catcher" the I/O chip was a "bit catcher". The bug in the original chip
was fixed very shortly after the VIC-20 began being produced, but too late!
So data is sent one bit at a time, and the 64 had to do this too.

What's worse is that the VIC-20 doesn't halt the CPU for DMA fetches
like the 64 does -- so the drive had to be slowed down even further,
to avoid timing glitches.

And the final irony: the 64 isn't compatible with the VIC disk drives :).

The moral: a) errors have a way of propagating, and b) never let marketing
make a design decision! :)

On the plus side, a little bit of software magic can speed up disk
transfers tremendously (like factors of 10-15 or even 25). So as a

practical matter, most 1541 disk access is actually pretty zippy. The standard software reads a 256 byte sector every 2.5 revolutions -- 512 bytes per second (really around 420 bytes/sec to load a file). JiffyDOS will up that to around 4300 bytes/sec. An Action Replay cartridge can up that to around 5700 bytes/sec (and systems like Warp 25 can _really_ up that, but are totally incompatible with normal files).

Comapre with 1000 bytes/sec on the Atari 810 (and 15,000 bytes/sec on the Apple II).

Now You Know. :)

Yep.

>Also using the same processor Atari was faster than the Commodore
>ever thought about being.

Sort-of. Although they use the same core, the 6502 and 6510 really are
different (minor point). The 64 also does certain things in hardware,
of course, which would otherwise eat up cycles.

Memory interleave is the main reason that the 64's CPU is clocked at 1MHz,
so a relevant question to ask is: how many cycles are available to the CPU
on each scan line in, say, Antic mode E or F?

And I've no doubt that C= thought about being faster :).

>Atari did use multi processors in addition to the main
>CPU such as the Antic chip.

1676. Atari 1400XL, 1450XLD, and portable 8-bit prototype?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-18 00:00:00 UTC
From: bitbrker@www.ionet.net
Message-ID: <887823500mnewsbitbrker@www.ionet.net>
Source record: 65842

Hi there!

I own an Atari 1200XL (192k RAM) and a happy-enhanced 1050 drive.
Although I primarily use my Amiga 1200/030-50MHz and an Atari Falcon
these days (and a couple of languishing PC's, one a 486 and one a P90),
I still like my (fully-functional) Atari 8-bit!

I've heard about the 1400XL, 1450XLD, and rumors that there once was
an Atari 8-bit portable prototype.

Can anyone give me the features/specifications of the above?
And would anyone be interested in selling one? I live in the USA, in
Oklahoma.

Thanks!

1400XL - 64K, internal 300 baud modem, internal voice synth.

1450XLD - same as above with the addition of 1 or 2 DS/DD disk drives.

65XEP - 64K, 3 1/2 inch disk drive, 5 inch B/W monitor, detachable
keyboard. Basically a 65XE in a giant case with extra goodies.

>And would anyone be interested in selling one? I live in the USA, in

I not ICD ect am going to try and hide what they did with the Ram Chips
if you have an old set and the Ram has gone out not a problem..either
order the new stuff or write me e-mail. This item comes with a ROM that
has to have the jumpers changed from 1 to 2 and from 3 to 4, only one
Issue not like ICD..either you have to be able to solder or have someone
available to solder. I am not hiding what was dont with the Ram chips
you if have a problem here duplicate the chips and be up and running
again. Feel this is the best way to apporch a dieing item?

I just completed my taxes and when researching my old Records I found an Item from FTe. I had the rights to produce the US Doubler in 1994 without any problems. My mistake I filed this stuff where I thought it would be readily available. Well to my sorry eyes here it is we K-Products does have the right to distribute the US Doubler since 1994 and have done nothing with those rights. I did attempt to contact Mike Hohman of FTe this month while I was in Phoenix but to no avail.

With the documentation I have the item if available at not ICD's price of
$49.95 plus shipping but $29.00 including shipping. Gurantees are in place along with installation manual. (which I have the rights to distribute)..If anyone is still intrested in this product they can send a check or money order to K-Products P.O. Box 22122 A.M.F Salt Lake City, Ut. 84122, or if you don't like P.O.Boxes not a problem..K-Products 4267 W. Midway Dr. Salt Lake City, Ut 84120..P.O. box saves 2 days mailing from my end.

Most Atari BBS sysops know about your "poor quality" statement.
Typically an 800XLor 130XE sees 5-7 years of 24 hour a day continuous
operation before failure. Very much
the way a florescent lamp lasts compared to the C64 which seemed to
always be crashing,
like having to change incandescent bulbs every few months.
Most 8 bits worked fine right out the box. (I personally never saw a bad
one and I worked for
Electronics Boutique for about 4 years.) You would get about 2 WORKING
out of 10 for the 64

That's cool! Does it come with software to access to voice synth?

> 1450XLD - same as above with the addition of 1 or 2 DS/DD disk drives.

I've also heard that these drives use a parallel rather than serial
interface. If that's true, I'll bet they are a lot faster than 1050's!
Also, how about the expansion bus that was on the 600/800XL. Is it still
present on those machines?

> 65XEP - 64K, 3 1/2 inch disk drive, 5 inch B/W monitor, detachable

Kind of sounds like an Atari version of an SX-64, except with a 3.5"
drive. I assume it still ran off of AC power though, right?

>> And would anyone be interested in selling one? I live in the USA, in
>> Oklahoma.

Speaking of, the version I got off of one of the archives mentions
an "unlimited lives" version. Now, I've been playing for a week
and just can't get past level one. Has anyone seen the unlimited
lives version, or a patch? If it's simple enough I could even try
Disk Wiz II. Help me out here.

I have stated this before. IBM supported their equipment with on-site
service.
no one else did (or could afford to) The IBM was available years before
the
MAC and IBM targeted their equipment to business. Add the on-site

service,
and the IBM was a no-lose situation for corporations.

I put together a sio2pc cable in about 25 mintues, Every thing worked great, I started to feel preaty good. I made an APE pro cable and have had nothing but problems. It will not "sync" I have checked and checked over and over and can not find a mistake in contruction. I busy light on my 1050 turns on when it tries to init the drive but then fails does anyone have a clue?

One question I ordered 3 14c89 chips and was sent SN75C189AN as a replacement is the correct replacement chip for the 14C89 IC?

Tom,
1) Be sure the 1050 is selected as the proper drive ID on the switches on the back of the drive. It must match the Drive ID APE thinks it should be.
2) Be sure nay other cables in the chain are good.
3) Check the 1050 by itself to be sure it is fully functional and can be use by the Atari computer directly (NO other devices in the chain).
4) Check all software to be sure it is configured properly for what you are doing and that your DOS works properly with APE. (This shouldn't be a problem. I believe all major DOSes work fine with APE.)

Just a few thoughts that might help.

It works with the most recent version of "XL-it"... I've also
played the C-64 version of it on "PC-64", it's nearly identical
to the Atari version.

]-
]- Oh and Atari mechanics are very poor quality.

'Bout that "poor quality" statement...I strongly disagree. I've got the same drive mechs. that I bought in 1983 for my 800XL (its a 1050) and it still is working just fine, and has never been touched. I know for a fact that I'm not the only one who has original "good as new" Atari equipment either!

Hmm...thought I read in several (early) mags. that the Commodore 8-Bit drives were notoriously unreliable and S-L-O-W... ;-)

I wouldn't go that far and say that. Atari did come up with many inovative ideas for its time. Also using the same processor Atari was faster than the Commodore ever thought about being. Atari did use multi processors in addition to the main CPU such as the Antic chip. Atari has always had a well buffered system, as compaired to the C=. I have repaired both. Yes I wish Atari would of done something different, but couldn't we all say this about our computer systems? I still do have my first Atari. A whole 16K memory when purchased, and I might add it still works as good as it did the day it was purchased. Mine is neither better or worse than the C=, but it is what I chose to buy.

Another problem with 22DISK is that it doesn't work worth a flip on my computer...a 686-P200+...worked fine on my 486...I think the faster machine screwed it up.

I think it needs more than ROM, like maybe more RAM? Maybe the RAM part of upgrades for the 1050 (like USD or Happy) were only for fascilitating the full track buffer I dunno. Maybe an updated ROM is all thats reqired. I would be interested in the answer myself. Anyone know?

Bob, I don't mean to be rude here, but this & your prvious post here
are unclear in meaning exactly. You, not ICD etc are trying to hide
something with RAM chips? Huh? That means you are trying to hide
something. Anyway, I gathered that you meant perhaps that you are not
trying to hide something that was concealed by ICD etc. in the past?
Hope that's right.... now... WHAT exactly about the RAM chips was
hidden that we should know about?

I have a USD that I bought from ICD a long time ago. It worked fine
until the day it was put in storage.

I am currently using News Rover w/Windows 95 on an IBM. It gives me the choice of replying to just newsgroup, just sender, or both when I hit reply.

This software allows you to download the newsgroups you prefer for off-line reading/replying, and I can highly recommend it. You also have the option to send the reply now, or to hold it for later if you are off-line. You can even schedule it to automatically call your dialup and retrieve messages on whatever schedule you desire.

The other newsreader I use is Netscape Communicator v4.04, it has similar options, but I have been unhappy with the off-line mode.

Hope this helps,
The Shadow

Oh good Rich, first you bring this thread here where it doesn't belong, and now you're trying to weasel out of it and shift the blame.

The blame is yours, and you are the troll, now get lost, and leave us happy, and loyal Atarians alone.

The Shadow

PS: I made sure this reply is only going here to comp.sys.atari.8bit, so please nobody respond to this. This whole thread is off topic and had no business being brought here.

1713. DOS 3 format failure

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-19 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6ch1mnhov1@newsd-199.bryant.webtv.net>
Source record: 65868

If DOS 3 cannot format a disk, due to bad sectors, etc. it will give up and return an error. Once in a while it will format a disk, and you will see a smaller capacity (due to the bad sectors), but the disk is unreliable, and should be discarded.

1714. Not Atari ED, but IBM ED disks

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-19 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6ch1dehoo1@newsd-199.bryant.webtv.net>
Source record: 65869

Enhanced density? I believe he was wondering why ED labeled disks would not format on his drive. In this case, ED does not mean Atari's enhanced density, but the 5.25" disks that have a 2.4 mB capacity.

He said he bought the disks at a Staples store, and since there were no Atari formatted disks that were ever sold, they are the 2.4 Mb ED density disks.

1715. XIO commands in DOS 2?

Hey man I think that about all of use that use the net have seen enough of this cr*p! I really don't care if you have a hard on for David Hunt or not, but come on give the rest of us a break. This cr*p doesn't belong in the 8- bit sig, now does it? You are as much of the problem with "spamming" as who you are bitching about is or might be. If you can't play nice with the rest of us "Pick up your marbles and GO HOME" Just stop pointing fingers and and saying I told you so. There has to be a better way to deal with this type of problem, than pissing off everyone. Your bitching and pointing a finger is going to backfire on you. Please just stop the bitching. It seams to me that you and just a small handful of people are creating most of the problem here, with all this "Junk E-mail" bull. Put you cards out on the table and lets get to the point that is tugging at you, I am sure that there is a better solution that all this E-mail garbage that is going on. Act responsible and settle this argument once and for all. Name calling and finger pointing is not going to solve anything, is it? E-mail me and lets see if we can work out a settlement on this problem..... I do believe that most of us here on this sig and others would like to see an end to this and other such e-mail

1-130 XE Computer
1-1050 Floppy Disk Drive
1-410 Tape drive
1-Commodore 1701 composite monitor (works great with the 130 XE)
1-Single Chip SIO2PC interface (PC serial port to Atari SIO bus)
1-P:R: Connection (2 serial ports, 1 parallel port adapter to SIO bus)

a couple dozen 8 pin 256k RAM chips

I also recently inventoried the included 32 carts and they are:

Alphabet Zoo - Spinnaker
Kindercomp - Spinnaker
Kids on Keys - Spinnaker
Fraction Fever - Spinnaker
Facemaker - Spinnaker
Computer War -Thorn EMI
Jumbo Jet Pilot - Thorn EMI
Submarine Commander - Thorn EMI
Congo Bongo - Sega
Buck Rodgers - Sega
Star Trek - Sega
Pitstop - Epyx
Jumpman Junior - Epyx
Astro-Grover -CBS
Miner 2059er - Big Five
Krazy Shootout - Kbyte
Soccer
Defender
Flight Simulator II XE w/ manual & maps
Asteroids
Ms. Pacman
Centipede
Donkey Kong
Joust
Qix
Star Raiders
Microsoft Basic II w/ disk and manual
Dig Dug
Pole Position
Pacman
Tennis
Missle Command

I also have alot of floppies included, which I haven't inventoried.

How about $150.00 for everything and I'll pay shipping (within the Continental USA).

Cool. That's what mine does too in that situation. I used a special
option that supposedly requests an email be sent as a follow-up. I
know that most software lets you choose to send both email and a
article, but when this flag is used my software pops up with a dialog
box sayng that the auythor has requested an email reply. Just
wondering what other people's stuff does. I am experimenting with
this because I do read the group, but really like an email sent as
well because that way I don't miss it. Sometimes one can miss an
article in the newsgroup.

*** Please make sure responses are also sent via email.

Hi, wondering if anyone can help me.... I didn't get this emulator with a whole lot of documentation.

Is there any way to use some graphics mode other than 320x200? At least 320x240, maybe 640x480 for games that use overscan.

What PC keys correspond to the start/select/option buttons? And the break key?

How do I get the emulator to recognize a joystick? (Does it do so at all?)

Actually, the casettplayer for the atari were JUNK, (I own four, all break down mechanically within two months of purcase). Also, even when functioning, loading a program is unrelably itself! I think the unrelability of the atari casette played a role in commodore being the much more sold machine... Now, the Atari diskette station (from the ol 810 clunkers onwards) are marvelous, much better than the sloooow ureliable commodore stuff. but in the begining, people usually started with casettes! Now, in my experience, the casette players was a exception, the other hardware are almost indestructible! (no stupid "avoid removing cables, or the computer/equippment might be damaged/destroyed" that 64-users seems to have had) DH.

I0IIMMII0I wrote:

> Hi All !
>
> Question : How do i copy files from datasette to floppy disk on atari 800 XL ?

I0IIMMII0I,
Your question is a little unclear. What I get from it is: How do I save data in memory to floppy(other mass storage device)? Well, that depends on on what is running on the machine. If you are using a programming language, it's easy. Create the data block in memory. I'll do this using Atari BASIC code. You'll need to know the start address of the data block and the total number of bytes it takes up. The following would read memory and capture it then put it out to the storage drvice.
1) make your data block in memory from what ever means you need to create it, then do the following:

```
100 mb= [start address of you data block]
110 close #1:open#1,8,0,"Dn:datafile.DAT"
120 for i=mb to mb+[number of bytes of your data block]
130 d=peek(i):put#1,d:n
140 next i
150 close #1
```

OR

```
100 DIM d$(1),dat$([number of bytes of your data block]):MB= [start
address of you data block]
110 close #1:open#1,8,0,"Dn:datafile.DAT"
120 for i=mb to mb+[number of bytes of your data block]
130 d=peek(i):d$=chr$(d)
140 dat$(len(dat$)+1)=d$
150 next i
160 ?#1;dat$
170 close #1
```

The second way is a bit faster even though it is longer code.

Now, if you are talking about saving data from a game... I haven't a clue. I don't do Assembler or Action!. I suppose there could be a way, especially if the game is run from a disk. Forget cart based games w/o a boot disk loaded.

Had lots of trouble with this one....

But after alot of fiddling about, I found that the Bounty Bob on Yogi's
megadisk 21 will work with a stock 1200XL. Not a 256K expanded machine
though.

Bounty Bob is a 64K game, so unless you have the cartridge it won't work on
an 800.

Good luck.

Graham

Yup. The first game I ever completed (first game I ever played long enough to complete). I think it took me over a year from the first time I ever played it to the day I completed it. The ending isn't much to look at, but just completing the game was a REAL kick.

Montezuma's Revenge, on the other hand, is a game I _never_ completed. Possibly because I only had a preliminary version which (for all I know) didn't _have_ an ending. Anybody completed that one?

SCSI? I've been out of the *scene* since I got my first Amiga all those years ago. But you can get scsi setups? So I could scsi network between an Amiga and Atari 800xl? Are then any formats read/write -able by both machines?

Adrian

From: Dean Garraghty <dgs@clara.net>
Message-ID: <01bd3e48$f0a8be80$LocalHost@pc001>
Source record: 65758

Atari 8-bit Enthusiasts,

As you may know, I am currently working on a 'History of the Atari 8-bit' video, along with Andy Leininger who is looking after the U.S side of things. We are now working out exactly what will be in the video, and this is where we need your help. We are hoping the video will contain info you never knew about before, and/or won't have seen before. This is what we are particularly keen to get hold of:

* Photos and/or film/video of Atari shows (or of the Atari at non-specific shows)

* Photos and/or film/video of any Atari promotions (in-house stuff would really be nice)

* Press releases announcing Atari products (including the original one from late 1978 announcing the 400/800)

* Rare/unreleased press releases (esp. for the unreleased equipment or unreleased games)
* Any ex-Atari employees who could offer inside info/gossip from within Atari
corp at the time of the Atari 8-bit's reign

* Any other material which people are unlikely to know about or are unlikely
to have seen before

If you can offer any help with the above items, or have any comments/suggestions about the video and its contents, then please send E-Mail to me at this dedicated video E-Mail address: video@dgs.clara.net

To find out more about the video project, please visit:
http://www.dgs.clara.net

Thanks,
Dean Garraghty

I agree with the other guy who posted a while back suggesting that a CD-ROM would be a much better format. A CD-ROM would let you view pictures, let you hear sounds, go right to the information you want instead of fast-forwarding through half-an-hour of video, etc.
A CD-ROM is much more durable than a videotape and you could view your CD right where you get most of your other information anyway...your computer. A CD could hold books worth of text-based information and interviews, and maybe even include some emulator demos or other neat stuff. All in all, I think it's a much better way to go. A CD might even be cheaper to manufacture than videotapes. Anybody agree/disagree? That's what this group is for. If you have an opinion on this matter...please post it. I'm curious what others have to say on the matter.

1751. Archived Software?

Newsgroup: comp.sys.atari.8bit

From: John Smith <x@x.x>
Message-ID: <6cl2mp$b6r@sjx-ixn3.ix.netcom.com>
Source record: 65760

Greetings. I am a newcomer (once-again-comer) to the group. Last time I was here, I remember seeing a few more ftp sites containing archived games / applications than I see now. Anyone know of a site that has a bunch of games archived together ("zip"ped, e.g.) for use with the SIO2PC cable and a PC? I found a site at umichigan that has a few files, but nothing substantial, considering the established software base!

I understand one can use APE with the Atari 8bit, but is there a routine to force a PC 1.2Mb 5.25" drive to write 180K (US doubler) and thus copy the ftp-ed files to Atari disk? Is this a route worth my time or should I build the SIO2PC cable?

Now that I think of it, I know there is a switch in the DOS format command that will write single sided 180K... but is it compatible with the US Doubler on the Atari drive?

Thanks in advance!!!

>]-So who's copying who? :)

Didn't exist??? Atari was around since July 1972. Atari was
interested in competing with Apple, Commodore wasn't even considered
competition at the time (poor judgement since Commodore made a cheapy
clone of the Atari with no DOS except in its tape drive speed 1541 disk
drives)
>]-
>]- Oh and Atari mechanics are very poor quality.

Poor quality? The Atari 800 was built like a sherman tank (weighed
almost as much too!) The XL line was very well built, it wasn't until
Jack stepped in with his "build it cheap" attitude and produced the XE
line with its mussy keyboard and ugly cases.

What does saving to disk have to do with writing to a cartridge???

Just put a DOS disk as drive#1 and if you hear/sense it booting DOS then you'll
be able to save to a disk file.
If the cartridge accesses the disk directly (never booting DOS) rather than
creating files through DOS then just put a blank non-file disk image as drive#1.
Any data saved will not be visible from any DOS.
(though you'd think that most non-DOS cartridges would either format the disk
themselves or else automaticly compensate for a DOS disk by blanking sectors
that it needed to use for itself)

>mode though, any way if you would like a copy email me and I'll
>send you it. It's two roms so you have to "virtually" flip disk
>when it ask, but that's not to difficult.

That really made no sense.The game came on TWO cartridges?

>BTW what should the SD/DD(single/double) dip switch be on for the
>indus

It just means what density to be set at when you turn on the power.
Since the Indus GT auto-detects the density of the disk.
If you notice the Indus GT spin-up when booting DOS even though it's not the
boot drive that's because DOS is asking it it's "STATUS" so it's accessing the
disk to see what density it is.If you've accessed the disk before
(reading/writing/statusing)
then this won't happen.Anoying if there's no disk in it.

So setting the density via the little white switch seems pretty useless.
(unless the drive is getting confused about dual density (1050) disks)

It's nothing to do with the BB,it's just how the 850 (and clones) work.
As I remember,the BB came out after BobTerm.
The point is that old (non-buffered) modems work.It's the newer ones that
don't.

Who would WANT to compatible with DOS 2?
(or DOS 1,which is just a difference of file format;the disks are identical)
I think SpartaDOS's filing system is the best,even if the DOS it self is a bit
loopy.
(POINT implemented poorly (c.f.QDOS for a good method),reading a non-existent
part of a file causes a sector to be written out for that part of the file,
no end-of-file in UPDATE (4+8) mode)
It sure beats the hell out of MS-DOS.
CP/M a good base for creating a DOS? I DON'T THINK SO!

(and yes,I know that with MS-DOS v1 it became quite different than CP/M.Too bad
it was still crappy)

That's another thing I've heard about.Aparently newer disks don't have that white (?) plastic ring covering the hub.So the spindle (?) touches the black disk surface it self.

This may sound confusing since people have taken to calling dual density disks "enhanced density",but you need double density disks to use the 1050's 130k format.

Even if you got someone to format a ED (?) disk for you,your 1050 wouldn't be powerful enough to write to them.Perhap you could use a IBM to write out a Atari format disk,but they'd be read-only.
(is this possible? The IBM floppy drives CAN do 128 bytes-per-sector)
I keep thinking that MULE (not the game!) could use 1050 disks on a IBM but I may be mis-remembering.

Just create a mega-image using APE and tell it "double density".
(which is a misnomer;you're just telling it to use "double-sized" sectors)
But remember that the last two sectors will be useless.So just create a image
with 2 more sectors than you need.
(this applies even to the new 1.16 version)

That's really very confusing!
I don't see why you could call it a EXE file instead of a COM file.
They're all executable!
And they're all external to DOS.
Plus the fact that SpartaDOS & DOS XL won't recognize EXE files,only COM.
(in MYDOS you basicly give them 11 character filenames,ignoring extentions)

I don't know what you mean by SpartaDOS's documentation.There's only one format
recognized by SpartaDOS.

Mine came with both the keyboard and BugHunt.(plug lightgun and FS2)
(no Barnyard Blaster,though)
Oh,to clarify,Missile Command was a built-in cartridge like BASIC.Not having
the keyboard pluged in or holding SELECT when powering-on activated it.
Just think,they could've put in a monitor/debugger but no,we get
MISSILE COMMAND!!!
At least give us a computer version of ADVENTURE (!) or a demo
showing/explaining each feature of the Atari,like that demo disk that
pre-buyers of the Saturn got.You know,showing the benefits of 16-bit sound and
the pass-filters and P/M graphics and smooth scrolling and 128 colours/lumnas.
(But I'd still prefer a monitor interface)

Well at least it came with Flight Simulator 2,which was kind've neat at the
time.

It actually uses the exact same format,it just stores files and directories
differently.So you'd have the smae problems as with other DOSes.
(there's really no way for DOS to change the way a disk drive formats with
normal stock Atari drives.(c.f.Apple)

Isn't that rather large?
Linux uses 32-bit FATs and it only uses 1k per block.On ANY drive.
Why didn't MS-DOS just go all the way and implement a new DOS that actually
gave you 1 sector-per-block along with REAL long file names.
(instead of aliases)

>BTW: Is there any advantage of DOS2.0S over DOS1 other than the
>memory savings from having DUP as a separate program?

DOS 2 can append to files.DUP 2 can also copy files with only one drive.
On the other hand DUP 1 can make aliases for devices.
(so you can re-direct P: to R: for RS232 printers)

DOS 2.5 has RAM-disk capability.And it can have 6 file/disk buffers instead of
five.This would normally be used to let you use 3 drives instead of 2.
This was so you could have the RAM disk.You'd just use the normal
3 files/2 drives set-up and then load the RAM-disk handler which would
automaticly add a D8: drive buffer.
(drive buffers are specific to a drive# so you're stuck with D1: and D2: unless
you re-configure)

And it comes with the DISKFIX programme which I really needed all those years
using DOS 2.5.(no one could just copy me the DOS master disk,it would seem)
And a programme to copy files from a DOS 3 disk.And a programme to set-up a
BASIC programme to run.And to configure drive/file buffers and write-verify.
And to auto-load the 850 handler.

People should take the time to catalogue the games that do this so they might
be included in file form in a ARC file.Hopefuly with information about which
sector they use.
(so you don't ahve to devote a complete disk image to each and every game)

I think that many (certainly Archon 2) file games were converted from
boot-disks.Of course boot-games assume that memory will be cleared out by the
COLD-START routines.Of course this is because they had no interest in helping
pirates copy them into disk files.

>-And that's on a real Atari and disk drive.

>pokey timers, etc. Doesnt pokey have something to do with inputs
>anyway?? (or just the paddle inputs, not the keyboard?)

POKEY means "POT and KEY" as in the paddles and keyboard.Of course it does so
much more!
It at least handles the interupts generated by the keyboard and reads the key
being pressed.(from some keyboard chip or the actual keyboard I don't know)
It's pretty simple,compared to the IBM.Pressed keys generate a 6-bit code
constantly while they're pressed.
SHIFT and CONTROL keys add on two more bits for 8 total.Also one of the POKEY
status register bits constantly tells you if the SHIFT key is pressed.
The BREAK key generates no key code but triggers a special interupt.The CONSOLE
(SELECT,START and OPTION) are totaly seperate from all this.The RESET key

causes a NMI (via the ANTIC,I presume) and no key code.
From everything I've seen the HELP key is just a ordinary key that is handled specially by the keyboard interupt routine.(the K: handler)

I've seen no evidence of key-codes getting lost like they can on the IBM.
(ever had it think that you had SHIFT,CONTROL or ALT pressed when you didn't?)

Build the cable, I fought for about a week tring to transfer games to an atari

floppy with NO success. You need a 360k 5 1/2 floppy for the pc but that
still did not help me. as for a ftp site I can offer a http site, mine

http://w3.one.net/~tom_cody

click games for all software
click util for some sio2pc cable instructions

>That's really very confusing!

Not to me. Not at all.

>I don't see why you could call it a EXE file instead of a COM file.
>They're all executable!

I'll explain it again, only adding a little. A COMmand file is a
particular kind of executable. It is an executable that extends a CLI
(command line interpreter) DOS's internal commands. In other words,
they are usually files which would have been included in the DOS's
built in (memory resident) command set except for maybe the programmer
wanted to not bloat the size of the kernal (DOS) or perhaps the
program was written after the DOS was published or was made by a 3rd
party programmer. An example of an internal command is DIR. One can
simply type 'dir' at the command prompt and it executes because it is
memory resident. Now then, I once made a program for SpartaDOS called
dirw (in WDIR.ARC - check it out). It was a utility that is actually
an external (non memory resident) command. It is executable just like
say a file like PACMAN.EXE, but it has the distinguishing .com
extension for two reasons:

1) It is an external COMmand (not just any old executable)
2) as long as it's in the search path, one can simply just type the
main filename portion and exclude the extension to execute it (JUST
LIKE INTERNAL COMMANDS!!! - gee what a surprise, suppose that's done
on purpose??)

It is inappropriate to call PACMAN.EXE, PACMAN.COM because PACMAN does
not serve to enhance, service, or add functionality to the DOS.

Now then, this being said... the Atari is not really too fussy about
filename extensions. You can really name anything almost anything you
want so long as it meets the 8.3 etc. rules. I could name all my
basic files with an extension of .FUN if I wanted. But if you're
going to talk about what is proper then I have outlined it above, at
least for executables. .obj, .bin, etc. are another discussion.

>And they're all external to DOS.
>Plus the fact that SpartaDOS & DOS XL won't recognize EXE files,only COM.

Not true at all. You simply just type the WHOLE filename. You would
type in PACMAN.EXE<return> This is at least true for Sparta, and if
memory serves for DOSXL as well.

>(in MYDOS you basicly give them 11 character filenames,ignoring extentions)

Like I said, one can really name however they want to. Doesn't make
it the proper (as far as norm in the computer field).

>I don't know what you mean by SpartaDOS's documentation.There's only one format
>recognized by SpartaDOS.

Huh? First of all, DOCUMENTATION is INFORMATION, usually printed but
can also be stored on magnetic, optical, electronic or whatever
media. It is not a disk format structure. The documentation may very
well discuss the make-up of the disk format structure that a
particular FMS needs but it's info for us to read or view. In any
event, as long as you ant to talk about formats that can be used with
SpartaDOS.... Sparta recognizes MANY FORMATS and can use more formats
than any other single DOS for the Atari8 (or any other 8-bit for that
matter) I dare say. Sparta supports much.

Cheers,

Jon

Actually, I am unsure if they are 4K. I had heard that was what
happens. I do have a FAT32 2GB drive.

>Linux uses 32-bit FATs and it only uses 1k per block.On ANY drive.
>Why didn't MS-DOS just go all the way and implement a new DOS that actually

>(instead of aliases)

Becuase there are a LOT of sectors on today's large drives. Think
about it.

Anyway, as to filenames... I rather look at Win95 as having real long
filenames, and also offering fake short names for MS-DOS
compatability.

I think CD-ROM is a bad idea. I'm into computers, etc, but I still appreciate sitting in my living room watching video. Does everyone really want to sit in front of the computer to watch the history of Atari?

Besides, filming to video opens up the market to showing it on late night TV...like the history of pc/mac video I saw recently late night on PBS.

But how comprehensive could a video ever hope to be? You couldn't pack it with thousands of screen-shots, or dozens of text-based interviews, or cross reference what programmers worked on other projects...I think that after you watched the tape a couple of times, you would probably end up shelving it. With a CD-ROM, you could go back to it time and time again as a reference. This is just my opinion. Any others?

Thanks! You have a great site! I'll build the cable and try APE, rather
than go the hardware route. I've seen several mods for the 800xl I have...
are any of them worth my time, as for RAM, etc? I probably will just end up
playing old games, no use for word processing, etc.

Yes, it will be alot simpler to use APE than to download files and
then try and rig a system to put them onto floppies that will just
have to be read again on teh Atari.

Unless you want to spend lots of time with floppies again :)

We decided on a video rather than a CD-ROM because more people could utilise a video than a CD-ROM. You are assuming that every Atari ethusiast has access to a PC with a CD-ROM. By my own research, this is simply not the case. Many people have an old PC they use for word processing or something, but very few people have what's needed to use a CD-ROM. Much effort is required to use an interactive CD-ROM, and many people just haven't got the know-how or indeed time to do this. With a video, you just stick it in the player, sit back and watch. Easy!

1792. Q: Disk/Emu File to Tape via WAV?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-21 00:00:00 UTC
From: ansk@hotmail.com
Message-ID: <6cmcklgna1@nnrp1.dejanews.com>
Source record: 65801
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm

I am looking for a utility which lets me create loadable tape
files for an old home computer via the WAV format on PC. I
have described more specifically what I am thinking
of in the list of actions below:

1. Use a PC to fetch the program file for the old home computer
from an ftp site on the Internet.

2. On the PC, run this utility, which converts the program
file to a WAV sound file.

3. Connect an ordinary tape recorder to the sound card's
low-level output.

4. Start recording on the tape recorder. Play the WAV file
on the PC in a default sound utility from Windows.

5. (After the recording is finished.) Move the tape to the
old home computer and load the software.

The background is that I found a utility that does the
opposite. After I have sampled old Atari 400/800/XL/XE home
computer tape software to the PC WAV format, it converts
the WAV to cassette file (on the PC/MS-DOS HD), typically
for use in Atari emulators.

I am aware of the well-working and more capable
hardware solutions that exist, for example the SIO2PC
cable for the Atari 400/800/XL/XE. But I would still
be interested in getting a complete tape-to-PC and
PC-to-tape set of tools for my old Atari and Commodore
home computers. The main advantage with the idea here
is that one does not need the extra hardware to connect
the old home computer to a PC.

Finally, I only have a tape-to-PC utility for the Atari. If
anybody knows of a similary utitility for the Commodore,
please let me know.

1793. Q: Atari Tape Loading/Serial Input

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-21 00:00:00 UTC
From: ansk@hotmail.com
Message-ID: <6cmf2t$j7c$1@nnrp1.dejanews.com>
Source record: 65802

While fiddling with conversion of Atari program files
on the PC for use in an emulator, I started thinking of
replacing the customized Atari tape recorder with some
other device. To be able to refine this idea, I need more
information on the Atari serial port.

Does the Atari tape recorder do something more than send
a stream of data bits from the tape to the computer? I can
think of more than one technical aspect on this:

1. Does the tape recorder demodulate the tones on the tape
and create digital data from it? (Or does the POKEY do
that.)

2. Does the tape recorder control the data transfer
rate in the sense that it provides a clock line to
the computer.

3. Relating to (2), does the tape recorder provide
any other control signals to the computer?

The advantage with using the tape type of loading
is that handling is fairly simple and no PC or other
physically big equipment is required to support the
Atari.

Anders

Stone me, we haven't had the current one yet.

It's next Saturday (28h Feb), town centre, Wetherby, Yorks for those who
fancy a jolly day out.

Why not both formats? Then you're covering both bases. I have a PC with a CD-ROM. I can tell you that most of the people in one of my 8-bit user groups don't. I can also tell you that many of them are strictly Atari users and don't have PCs or Macs. They'd appreciate the VCR approach.

But some do have PCs with CD-ROM, and for those, I think the CD-ROM would be useful and probably make you guys a buck or two.

: machines?

: Adrian

No, as far as I know, the formats are incompatible. You have to place a
high level format on your Atari 8 partitions which are Atari Dos like (MY
Dos) or Sparta Dos.....I doubt you could multiplex a hard disk to have
both Amiga and Atari information on it, and usable by each machine.

I never did Wizard's Crown to work on the 8bit.. I have the .ATR files but
there is no 8bit emulator that runs this game.. even Phantasie dies after
loading the main screen..

Hmm.. maybe I should convert the .ATR files back to *.DCM files and
run them on my 8bit? heheh

>3. Relating to (2), does the tape recorder provide
>any other control signals to the computer?

I think that the digital to analog audio is done inside the Atari (probably by POKEY) and not in the program recorder itself. A couple of clues that tip me off to this is that

1) I seem to remember special adapter cables one could buy that would allow the use of a standard cassette recorder as a datasette. Any tape recorder that had the "microphone" power on/off control jack thingy could be used.

2) Though I know this is in the opposite direction and does not prove anything, I do remember that if one put an audio tape in a program recorder and tried to load software or a file from the cassette, you would hear the audio of the cassette routed in through the SIO port on the computer and routed out to the monitor sound jack. It would not make sense that Atari specify that digital data be converted to analog audio inside the program recorder for output to a tape, but then not do the opposite conversion for input data as well. It is however possible.

: > Question : How do i copy files from datasette to floppy disk on atari 800
: XL ?
: >
```

In order to copy boot tapes ie: Machine language prorams, you can use a nifty program published in Compute's Second Book of Atari. It allows you to make a copy of a single stage tape on to a floppy disk. It is in a unique format and uses an entire disk however. With the cost of disks these days (free for most 5.25's) this shouldn't be an issue.

1810. Long file names vs. aliases

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-22 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6comt9$o69$1@newsd-199.bryant.webtv.net>
Source record: 65683

Most likely reason for aliases instead of true long filenames is simple-
COMPATIBILITY! Without a radical change, most people demand that it be
compatible with their older programs that use standard filename
conventions.

Like OS/2- if you used HPFS (that allowed long names) it could not be
recognized by a regular DOS (Windows, etc.) partition, because it uses a
FAT system.

And althought OS/2 was superior to Windows 3.1 (and Windows 95, in my
opinion) it was the COMPATIBILITY bugaboo that virtually killed it.

1811. Sectors free rather than kB used

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-22 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6conf2$o6l$1@newsd-199.bryant.webtv.net>
Source record: 65684

Probably the reason DOS used a sector free count is that it took up less memory. Remember, memory was really scarce and it was remarkable what they crammed into an 8k cartridge. (Star Raiders, yes!) To convert sectors free to a byte count used would have used precious memory, and if you think that wasn't true, why else did they use error numbers, rather than plain English? Okay, without looking it up, what is an ERROR - 163?

At least under DOS 3, since a block was 1k, you knew how much space a file used.

1812. NO CD ROM- use videotape

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-22 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6coo8d$o72$1@newsd-199.bryant.webtv.net>
Source record: 65685

No. Videotape would be a better form. I would rather pop in a video tape, and view it on my big screen, than sit hunched over some puny monitor, watching some jittery MPEG video.

And if there are any hopes of selling this, what computer software buyer is going to buy a CD-ROM about Atari? At least in video stores, they are more open about Atari, and may want to see some behinds the scenes stuff about the games they used to play.

You know the score, would you go to a party and say that you have an Atari computer? "They made computers?" is what they say. But when you say you had an Atari game system, they'l say, "I had one too, they were cool."

Go with the tape. Axe the CD-ROM

1813. No CD-ROM- and why

Newsgroup: comp.sys.atari.8bit

It was binary (written in assembly) and it didn't have a filename because
it was meant for use by cassette-only users. You run the program by
booting from cassette (OPTION key while cold booting).

Eventually I got a floppy drive and saved the source code as superdup.asm.

Yes you are referring to the demo cartridge. It did alot of little demos of sounds - graphics and things the ol machines could do. I still have one of them cartridges around somewhere. It was cool for its day.

1830. History video - some comments

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-22 00:00:00 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <01bd3fb9$338cb140$9d5008c3@pc001>
Source record: 65703

It seems I have started quite a debate about my History of the Atari 8-bit video!

Let me just say this. I AM NOT DOING A CD-ROM. There is a book coming out, which is one project. I am doing a VIDEO, which is another project. A CD-ROM would be a whole other project. If somebody wants to do one, then good luck.

I am amazed about people talking about renting the video. UH????!!!!! I think people think this is going to be some professional TV programme directed by Steven Spielberg!! It isn't! The video will be available to buy, and that's that. No rentals, no appearance on a TV station. I have had E-Mail from LOTS of people who want to buy it when it's ready, and BTW, far more people asking for a video than for a CD-ROM.

Dean Garraghty

1835. Atari Video

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-22 00:00:00 UTC
From: Andy Leininger <akablinky@email.msn.com>
Message-ID: <OeM1kq#P9GA.226@upnetnews04>
Source record: 65708

Hello all. As a fellow Atari lover, I will be working with Dean on this project. From the start, Dean's idea was to produce a video with the intent on presenting the history of Atari as a company. My idea, and probably what I will focus on with the production will be an overview of the different machines made throughout the years. I feel that in that way, the video will serve as reference of the different models, and also help to introduce those who may not have known the differences between them. As far as producing a CD-ROM, that also would offer a unique view on the machines, and attract people who would like some kind of archive of the different models. However, I do not have the facilities to produce something of that nature.

At this point, I need to collect more Atari computers and peripherals for the video. If anyone has excess computers and parts laying around that they would like to contribute to the project, please e-mail me. I don't have a huge budget to work on this, it's just something that appeals to me, and I want to see happen. Anything dealing with Atari would be appreciated. Also, please visit my webpage set up for this project, at http://www.geocities.com/siliconvalley/pines for the latest information.

Thanks for any help anyone can offer!!

Andy Leininger

Microsoft asks, "Where do you want to go today?" I reply, "back to yesterday, when Atari ruled!" (but, of course, Atari lives on!!)

1836. SDX Cart and Examiner ForSale

Newsgroup: comp.sys.atari.8bit

Hello Atari Users,

We have for sale a SpartaDos X cartridge version 4.21. Dated 7-10-89.
We have not heard from the person who was suppose to purchase this
item. Alot of people were interested in this cartridge so to be fair it
will be sold to the highest offer over the original price of $25.00.

SpartaDos X Cartridge version 4.21. Dated 7-10-89.
Like new. No manual or box.
Price-Best offer over $25.00 plus $3.00 for shipping.

We will accept offers on this item for 3 days. Then the person with the best
offer will be notified by e-mail.

Also forsale, The Examiner by Convologic,Inc.
This is a cartridge reader for the Atari 8bits that will move any or all
portions of an 8K or 16K cartridge image into computer memory and allow
this image to be saved to disk or cassette. Software modifications can be
made and WAM cartridge files can also be created.
This should work on any Atari 8-bit computer. Was tested on a stock 130XE.
Package includes:
Cartridge Interface, Original disk and cassette software, and Manuals.
Price-$30.00 plus $3.00 for shipping.

These items are only for sale in the US.
If you are interested in any of these items then you can contact us at the
e-mail address below.

Thanks,

From: marknewtonjohn@webtv.net
Message-ID: <6cr7kv$q8g$1@newsd-199.bryant.webtv.net>
Source record: 65713

There was an ST version that I remember when I worked at a computer store (1988) that sold Ataris, Commodores, and built to order PCs. I think I still have that disk.

I think I saw that B&C Computervisions is selling an 8-bit POS cartridge.

1841. Oh, snob factor? Hmmm?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-22 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6cr91d$q97$1@newsd-199.bryant.webtv.net>
Source record: 65714

Oh, snob factor creeping in? This is rich, here we are, on an ____Atari 8-bit____ newsgroup, and someone is implying because I am using a WebTV, that I do not have a PC and a CD-ROM? Did it ever occur to you that I have other equipment? StiK and CAB are a pain in the ass. Setting up Netscape is a pain in the ass, too. What's wrong, if I can set up my WebTV in 5 minutes, I can't post on newsgroups?

I've been with an Atari since the beginning, back in 1980. I started with a 300 bps modem and accessed the internet with T1 lines. I've sold computers from 4.77Mhz XTs to 300MHz Pentium IIs. Do not assume because I have a WebTV, I do not have access to a CD-ROM.

I work at an electronics retailer. 99% of our customers are not bit-headed nerds. I am speaking on what the majority of the people that would be interested in seeing behind the scenes of Atari, not trying to single out people that ONLY have this PC, that ONLY use this CD-ROM.

And what of the other users that have Apples? Or the Atari die-hards that have not sold out and still use their 8-bits or even their STs, much less those who even managed to connect CD-ROMs to them. Now explain how an ST or even an 8-bit user will use an MPEG CD-ROM, much less even a QuickTime CD-ROM?

These days, VCRs are commodities. Most of the households in the US have VCRs. Intel/Microsoft PCs are not even close to becoming a commodity. You will instantly limit who will see this CD-ROM. And the point of this excercize is to show people what Atari was.

Computer snobbery is hard to eliminate. It was there even in 1985 when BBS operators wanted to lock out 300 bps users and limit it to "only" 1200 bps users. Does that mean that only people with computers should access the internet, or exclude those with WebTV or Net PC terminals? This should end right now.

1842. Re: Sectors free rather than kB used

Source record: 65715

Ah, but was space _ever_ a problem? I mean, truly?
Sure, if you had a 300 byte recipe, it would take up 8 sectors (1 block), rather than the 3 sectors that DOS 2 would have used.

Even so, I think getting 127 recipes on a disk is a task, forget whether it took 1 block or 3 sectors.

And who didn't notch their disks? So that means you could have at least 254 recipes under DOS 3, even more under DOS 2. But, WHY? DOS can't have that many files anyway, as I understand it, I thought you could only have about 64 filenames per disk (side).

The most I have on a disk are short AtariWriter files of diary entries, one for each day. Disks were cheap, and who wants to wade through a ton of filenames on a DOS menu to find a particular name?

I sure don't see anyone screaming that a hard disk uses up the equivalent of 32 sectors (4k blocks) to save that same 300 byte recipe, instead of only using 3.

re: Videotape vs. CD-ROM for Atari history...

Please forgive lateness of reply...

Not everyone has or wants to buy a PC capable of playing these CD-ROMS. Videocasette recorders, however, are machine non-specific, and most people own one. I, for one, would like to see footage from Atari's earlier days on videotape. I hate WinTels, I always will, and I will never buy one, and my brother's trials and tribulations only serves to cement my resolve. I may buy a Falcon and an Amiga, but Macs and PCs both suck bigtime in my humble opinion. My brother has a Cyrix 6x86 with 64M running WinDoze '95. It, in a nutshell, is an unreliable piiece of crap. No, he is not an ignorant user, he builds and upgrades them as a side business.

Does anyone have access to or know any specifics on either
the Amy or Marie chips? I remember reading in a Byte
magazine that it took a VAX to program the Amy chip. Somehow
it would take a natural sound like a violin, do some number
crunching, and reduce it to an equation usable by the Amy
chip to reproduce the original sound at any pitch or timbre.
Early wavetable synthesis? Or something more advanced?

I believe that there was a program in A.N.A.L.O.G. that allowed
DOS 2.5 to use 30 character filenames. Tom Hunt a while ago
expressed interest in adding certain UNIX features to
SpartaDOS, including 256 character filenames.

>Is there any way MyDOS, DOS 2.5, SuperDOS, SpartaDOS... could be changed to
>allow LONG filenames with other characters?

Allowing the use of the full character set with case-sensitive file
names is no problem. MyDOS already does this; I don't know about
SuperDOS or SpartaDOS, but there are just a few pokes to make DOS2 do
it.

Long filenames are a problem. You would have to modify the structure
and size of the directory, making it incompatible with any
non-modified DOS. Perhaps for DD disks you could do some hack using
the upper 128 bytes of the directory sector for extended filenames,
giving you 27 characters per filename, truncated to 11 for unaware
versions of DOS. Perhaps for non-DD disks you could reserve an extra
8 sectors for the extended filenames, though that would be very
inefficient.

Of course, you couldn't use any existing menu programs with the
extended filenames, and it would be a fair amount of work.

At this point, the simpler thing to do is to write a menu program that
uses a description file with a translation between the filenames and
the actual program names. So as long as you're using your menu
program, you can pretend that you have long names.

Source record: 65829

Hi

Yes, a long time ago I wrote a program that I called SuperDup. It copied cassette programs. I wrote it in the early days when cassette was still more popular than disk drives.

Over the years I lost the source code and all copies of the executable program. I know the chances of me finding it are None and Remote. It was not a retail product. Just something that changed hands at user group meetings (it was supposedly very popular as a freeby pirate program).

If anyone has a copy of this please email me a copy or email for my postal address if you can send a copy on cassette/disk.

Thanks.

Fernando

Oh heavens, no. Are you kidding? DOS 3 for a hard disk?

Actually, I don't think you could even format a hard disk under DOS 3.
Remember, 10 Mb drives were enormous back then, and hideously expensive.
I don't think that hard disk compatibilty was even written into DOS 3.
(I don't think I even HAVE 10 Mb of 8-bit stuff)

Maybe that was what the PBI bus was for, to connect the 1090 Expansion
Box, and put a small MFM drive and controller into it.

Gee, maybe one CAN format a hard disk with DOS 3...

NAAAAH.

Source record: 65634

I'm pretty sure that the Atari cassette drives (410 and 1010) sent digital data back to the computer. Hence, if you want to save cassette software to a modern storage device, I suggest snooping the data transfer with an SIO2PC cable.

The other thing you should note is that the Atari cassette drives are stereo, not mono cassette recorders. When recording, I believe that they store the same data on both sound channels, but when playing, they interpret digital data from one channel and play the other channel as sound. Hence, if you have a slightly garbled cassette, one solution might be to copy it to another tape with a good stereo system, but swapping the sound channels. Some games took advantage of this feature by recording music or other audio data on the non-data channel.

I'm curious, though, how many programs are there on cassette that haven't already been converted to disk? If they are your own files, then the conversion should be trivial. If they are commercial tapes, then there was probably a disk version that you can find on the net.

There might have been some foreign language (educational) tapes that would be hard to convert to another format due to the use of analog audio mixed in with digital data.

From: Frank-Oliver Malisch <fom@mchp.siemens.de>
Message-ID: <6csi5n$ob9$1@salomon.mchp.siemens.de>
Source record: 65636

Hi,

I once owned an NTSC A800, that now seems to
experience some technical problems. It was actually
a machine rebuild from PAL in order to get the
color artifacts (e. g. Loder Runner, Drol, etc.)
As I can't get this machine to work anymore, I would
like to know what colors are involved in TV artifacting.
I have the section on artifacts from De Re Atari, but
it does not cover how the artifact color relate to
each other and the color originally set by the user
in high res modes. As far as I remember, the artifact
colors were influenced by the hue setting.
What is there relation in the HSV-Color model ?
Does the basic color have an influence on the
artifact colors (that is: does it make a difference
if you use white pixels on black or for examples
light green pixels on dark green ....)
Is the color artifacting in Xlit realistic ?

I need this for an emulator enhancement.

Thanks in advence

Frank-Oliver

From: phantomm@eastky.net
Message-ID: <6cssca$a4v$1@ns1.sols.net>
Source record: 65641

Hello Atari Users,

We have for sale a SpartaDos X cartridge version 4.21. Dated 7-10-89.
We have not heard from the person who was suppose to purchase this
item. Alot of people were interested in this cartridge so to be fair it
will be sold to the highest offer over the original price of $25.00.

SpartaDos X Cartridge version 4.21. Dated 7-10-89.
Like new. No manual or box.
Price-Best offer over $25.00 plus $3.00 for shipping.

We will accept offers on this item for 3 days. Then the person with the best
offer will be notified by e-mail.

Also forsale, The Examiner by Convologic,Inc.
This is a cartridge reader for the Atari 8bits that will move any or all
portions of an 8K or 16K cartridge image into computer memory and allow
this image to be saved to disk or cassette. Software modifications can be
made and WAM cartridge files can also be created.
This should work on any Atari 8-bit computer. Was tested on a stock 130XE.
Package includes:
Cartridge Interface, Original disk and cassette software, and Manuals.
Price-$30.00 plus $3.00 for shipping.

These items are only for sale in the US.
If you are interested in any of these items then you can contact us at the
e-mail address below.

Thanks,

phantomm@eastky.net

1870. Snokie 16K or 32K

Trying to prepare for a move. Would like to get rid of this stuff:

Atari stuff:
800
800 (video goes out after heating up)
800xl (don't think it ever worked)
850
810 (happy rev 6.?)
820
power supplies cables floppies
lots of books and manuals - send for list
Hayes Smartmodem 300

couple vcs systems (not sure if they work)
lots of joysticks and misc parts

other stuff:
commodore vic20 (don't think it works)
286 mb
5.25 disk drive
misc video / io cards
misc cables

Couple reels of maxell audio cassette refill tape
some real thick coax (broadcast looking cable)

shipping would be from Baton Rouge, LA.

1874. Atari Joystick recommendations?

Hi,

I'm trying to put together a comprehensive help area for Atari users. This isn't meant to compete with any established sites, just to provide another resource. I've been combing sites looking for interesting help files, and then emailing the site owners to ask permission to link to the files, but it's taking a while. Therefore, I'd also like to get some input this way....
Do you have a/some useful file/s on your site? Would you like to ensure that there is even greater access to them? If so, I've put a form up where you can provide me with all relevant information. You can link to it directly at:

http://www.geocities.com/SiliconValley/Peaks/6320/ahd01.htm

if you don't feel like trying to locate it on my site.

Any information (as long as it's legal) is welcome. FAQs, hardware/software help, histories, anything.

Thanks!

Terry Ross

WebTV rulez. It's a cool gadget and has good basic interfaces for the WWW, UseNet, and IRC. I am dutifully pestering the programmers about a Telnet feature, and maybe one day webTV will have that too.

I've seen the snobby putdowns from people who think they are better/smarter/richer or whatever than webTV users, but they are full of it. There are usenet groups such as rec.arts.discussion.poetry (I think that's the correct name) where many webTV users are making great, intelligent posts. And WebTV users don't make the stupid, pointless attacks on other posters (flames) as much, in my experience.

But back to the Atari videotape/CD-ROM discussion. I vote CD-ROM, it's just the kind of thing I'd prefer to watch on CD-ROM, when I felt like it, or wanted to reference it.

It (and most of the other CBM drives) also used a variable read/write
clock
to pack more data on the longer outside tracks. This is the primary
reason they were able to get incredible density from their disks. Apple
tried to do a similar thing with the Mac DSDD floppys but they used
a mechanical technique, varying the speed of the drive motor. I often
wonder if Apple went to this much more difficult method of zone
recording
because of Commodore patents.

I know Wintel machines corner over ninety percent of the market, but there must be some sort of emulator made to use on the Mac for the eight-bits. Got an 800XL, works fine, but get stuff from the ether by PPC 7200/90. Can games be emulated on the Mac? Is there a cable? If you've got a lead, please let me know.

Atarian compatriots,

I have a schematic for the ATR8500 - this is not a typo - the ATR8500. I also have the actual ATR8500 "motherboard", power supply, cables, etc.

However, I do not have the Atari "daughterboard" for the ATR8500 or its schematic. If anyone has the schematic for the "daughterboard" or has an actual Atari 'daughterboard", please contact me. I do have a "silkscreen" diagram for the "daughterboard" but have no idea how the traces run.

I also have an ATR8000, but no schematics. The 8500 is similar, not identical, to the 8000 (different component layout,different jumpers, different ROM, etc.).

If you'd like a copy of the 8500 schematic please contact me.

And the answer is "No", I do not wish to sell either the 8000 or 8500 at this time.

I am located in south central Pennsylvania, USA.

Unless you use the Max232 version, there isnt much to the interface
at all. The 1489 version is a nice hack by Rick Cortese, you can get
the parts list at my web page below if your still curious about
whats in it :)

Hi everyone,

Just wanted to let everyone know that I am now on the web. A few of the links are not working, but the catalog is fully operational. In a few short days I will be updating the catalog with about 30 new items with many more to come along. If you have any questions do not hesitate to ask.

Your best bet for now is to keep checking back, you never know what you will find here.

The web page is located at:

http://pw1.netcom.com/~jonart/VMC/

You may contact me via this email address:

Vintage_Micro@yahoo.com

Thanks,

Jon

PS. Let me know what you think. It took me a while to design this. I hope you like it.

1894. IDE / MFM / RLL HD for 8bits?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-23 00:00:00 UTC
From: Johnny Zymurgy <thehelmet@hotmail.com>
Message-ID: <6cro74$h2a@sjx-ixn5.ix.netcom.com>
Source record: 65728

Okay, I've read the FAQs... but all the mentions to proposed hard drive mods just increased my appetite! Where do we stand with this?

I'd like to build a very cheap interface to take an old hard drive (no need for a 4Gbyte unit!) and connect it to the parallel bus of my 800xl. I know the impetus would be for doing this with an IDE drive spec., as this is available everywhere... but what about doing it with an older MFM or RLL drive (a 20-80 Mbyte unit)?

Is the approach to interface a stock x86 ISA controller card with the PBI of the XL? I just don't see the sense in making this project cost any more that it has to; there are so many old HDs out there, practically free.

I suppose this would necessitate booting from a floppy prior to accessing the hard drive with some special routines. What about instead taking an old 1050 / 810 / etc. drive and going from there? Okay, it would be damn slow, but you could possibly boot from an image containing the appropriate software on the hard drive, skipping the floppy entirely.

On another note, what is the cheapest, most compatible method of upping the memory of the 600xl to 64K? Is the mod published somewhere free? Thanks in advance!

I justly enjoyed locking the 300 bps out since a full blown pirate board didn't want 300 baud "lamers" clogging the lines. Besides, it was a private bbs anyway

Sell the 600Xl and buy a 64k 800Xl! :) <grin>

Sorry for the dry humour, but there never was A CHEAP, EASY way to upgrade
the Atari 400 or 600XL.. I'm not saying it wasn't possible, but the ones I
read about needed some soldering.. not my idea of an EASY upgrade. (not
like the PC, where youplug in the 16 MEG SIMM and away you go)

1898. Re: Q: Atari Tape Loading/Serial Input

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-23 00:00:00 UTC
From: ansk@hotmail.com
Message-ID: <6csbpb$b6t$1@nnrp2.dejanews.com>
Source record: 65732

Here is additional information on this subject, about
prerequisites for Atari 400/800/XL/XE tape loading.

<Copied from an email I sent:>

Anyway, my impression now is that the transfer speed for
tape loading is set to one specific (slow) bit rate or
possibly to a bit rate interval. I mean, set by the
computer's OS.

One of the reasons to why I posted the original article
was that I wanted to record Atari tape files as sound on
audio CDs and load games with an audio CD player connected
to the computer. As soon as one has got the compact disk
programmed with Atari software, the device would be easy to
use and occupy little space. An irritating thing about
this solution is that a couple of 10-20 minutes sound files
would fill up a whole CD. Not efficient use of the circa
600-800 MB of space that a CD is supposed to have.

The next step (assuming the conclusions done so far are
correct) is to find out if the external device has to
stick to the slow bit rate, or if it can increase the
transfer speed somewhat (but stay in a reliable
frequency interval).

While we are at it, the Commodore 64/128 computer series
had a fast tape loading mode, called 'turbo'. I heard
somewhere that such a solution could not be implemented
on the Atari, due to some technical compromise in the
tape recorder.

<End of email copy.>

Any additional comments will be appreciated.

Anders

Yes, for example Synapse Software's Zeppelin (excellent game)
made the beepy loading sound go silent and played music from
the other track while loading. Would have been called
'real time audio' these days. ;)

> ... how many programs are there on cassette that
> haven't already been converted to disk? ... If they are commercial
> tapes, then there was probably a disk version that you can find on
> the net.

You are right, but that is not my point. I seem to have confused
you and also other readers/authors on this thread too.

The main thing, which I mentioned at the end of the original
article, is that I would want a stand-alone Atari system that
occupies little space, for instance at work. One good solution to
that seems to be an Atari 600XL with internal memory expansion
and a portable audio CD player along with it to load the games
from. The CD player could be in a very thin base unit below the
computer.

Anyway, thanks to you and to other people who have described
PC based solution aspects in your replies. I need that too, the
SIO2PC cable, but for a different purpose.

> There are several fast tape loading modes on the Atari 8-bit:
> You have Rambit (UK), Turbo 2000 (Poland) and some others
> probably... They load at least 400% faster than standard
> stuff.

Do you know if one has to (so to speak) load the loader
before one loads the actual program? Or does the fast
loader utility save files with higher bit rate that
the built-in Atari OS recognizes? The latter would
be incredibly suitable for my purpose.

The reason I ask is that I would, for the audio
CD purpose I have mentioned in other articles on this
thread, want to load software directly from an
audio CD player without any unnecessary extra
actions involved.

About the audio CD alternative, unfortunately the
tape recorder seems to send digital data to the
computer. This is according to a follow-up article
by Olav Queseth.

(I will look for the fast loaders on the web and find
out.)

>the basic locations for using the IOCB.

XIO for disk directory? I always knew it as an open.. Sample program to do directory listing...

```
10 DIM A$(40)
20 TRAP 100
30 OPEN #1,6,0,"D1:*.*" : REM put whatever directory you want in there
40 INPUT #1,A$
50 ? A$
60 GOTO 40
100 END
```

Greetings,

I am wanting to find an Atari 800 disk drive in working order. I would prefer an "Indus" disk drive, but will entertain others. I am also looking for cartridge or disk based software for the 800. If you are a vendor of such products, please E-Mail me with a website address or a list of the products you ahve available

Thanks
Michael

>box, and that in itself is very impressive. *BUT* the mainstream "mob
>mentality" dictates (yes, DICTATES) what platform is most popular...
>and this is bloat-ware pc crap.....

I have to agree to some extent. Without a doubt it wasn't "just pir8's" that killed the 8-bit. C-64's still had a plethora of software coming out for it long after most commercial atari 8-bit software developers abandoned the platform, and the C-64 piracy seen was huge and more organized then the Atari scene ever was, even in 1990.

Atari, and the Tramiels, did more to shoot themselves in the foot then any other thing. If they themselves only continued to support the line it would have lasted a few more years, but the reality is there's not much incentive to develop commercial software for any 20 year old platform (see any Apple 2 stuff these days?)

If the "piracy killed the atari" theory held true then the wintel platform is doomed soon (have you done a web search for "pirate ftp sites" lately?) without the DOJ.

In some respects, some old pirates are doing what they can to keep the memory of the 8-bit alive then anyone else (please don't try and tell me that Jellystone Park was your run of the mill "pee-dee bored" back in 1984).

Lance, or Video 61 has been rather high on his prices but he has
continued to support the community for years. I personally know he has
attempted to bring items thought dead to us the users and has like
everyone else gone into a sinking hole.

If you need anything you can't find then give him a call as 612-462-2500
he has stuff in his warehouse I only vaguely remember. Be it games, for
the 2600, ect to what you want now. He has kept in touch with Atari
Corp.
and had permission to re-produce many items they had available but are
no longer available. He does have developers available to him and has
taken
Sparta Dos 3 to cartridge, along with supporting many games and programs
not available to us the user from any other distributor.

Give him a call, support his efforts, he definitely supports yours.!!

Message-ID: <01bd4156$dcb6c3c0$LocalHost@fivvwrpw>
Source record: 65489

Hi all

Can anyone explain the principles of remapping the drives as per SpartaX's 'swap' command but using disk versions of SpartaDOS?

Essentially, I want to load up the CC8 compiler, Ace C linker (and associated files) into a RAM drive and remap it to look like drive 1 -- so that I don't have to suffer the 30 minutes of agonising grinding every time I compile hello.c ;-)

I've read Inside Atari DOS and scanned Mapping but without success. Maybe I'm being stupid (it's likely...) but I can't find what I'm looking for. Also, I'm assuming that there's no equivalent swap command in a disk-based SpartaDOS?

Thanks

Jerry

```
>I would like to solicit opinions about alternatives.
>What joysticks do y'all out there like to use?

In addition to the Atari, the TI-99/4A (via adapter) and most
other home computers use the joystick standard set by Atari.
If you get a Sega Genesis hand controller set ($10 at Toys
R Us), it is a very easy modification to make it Atari
compatible. I have altered several, and prefer them (in most
cases) to regular joysticks.

Re: the Atari IN-store demo...

I got my cartridge from a store that had previously been an
Atari Dealership, so it had actually been used at one time.
I really am amazed that I have a copy, so I cannot part with it.
However, there is a disk copy of the original demo, along with
a pornographic version (funny!). The store I got it from was
one in Findlay, OH, and at least the last time I was there, they
still had a 5200 kiosk set up for the kids to play! I tried
to ask how much they'd sell it for, but the guy has two and
doesn't want to sell either. The demo cart was the same I used
to watch with awe years ago in Sears as a mere youth.
Memories...

I'll see if I have copies on disk and possibly uue them here.

You can get the cmos version of the 1489 at any well stocked electronics place.

Try JDR or Jameco, both are under a buck.

Jameco Part# 16379
JDR Part# DS14C89

Try JDR first, last time I ordered with Jameco I spent $150 and got
$140 worth of stuff I didnt order, and had to ship stuff back 3 times.

Re: 600XL 64K memory upgrade...

Best Electronics (catalog rev 10) lists the Atari 1064 600Xl
64K upgrade as $24.95, the complete package. For compatibility,
you can't beat True Atari equipment!

I would suggest to any one who doesn't have this catalog, IT IS
A MUST BUY! It contains such a wealth of information that you'd
be crazy not to get one. The history alone that you learn is
worth the price of admission! Their number is:

1-408-243-6950

The addres is:

Best Electronics
2021 The Alameda, Suite 290
San Jose, California 95126 USA

I finally got off my butt and got one. I was really glad I did.

No it does not.

>1. Does the tape recorder demodulate the tones on the tape
>and create digital data from it? (Or does the POKEY do
>that.)
The tape has a FSK demodulator. Pokey converts the serial
bits that are input onto the SIO bus into bytes.

>2. Does the tape recorder control the data transfer
>rate in the sense that it provides a clock line to
>the computer.
No, it is a-synchroneous data. In fact, I think there is no
device in existence that actually uses the clock lines on
the SIO bus at all.

>3. Relating to (2), does the tape recorder provide
>any other control signals to the computer?
No. The computer can control the motor, that is it.
But that is the other way round.

All this, and everything else about tapes that nobody
really cares about is in the documentation that comes
with the wav2cas program that can be found at the
Umich archives. Sometimes it pays to read the
documentation.

You will find the anwers to your questions about storing tapes
as sound on a CD and increasing loading speed in that piece
of documentation too.

On 23 Feb 1998 23:47:22 GMT, jmouchmino@aol.com (JMouchmino) wrote:

Check out <http://www.emulation.net/>. Its a big list of all the emulators
available for PPC Macs (and some 68k, too).

Last I heard, there is no SIO2Mac, which is something I'd like to see, also.

Give these a shot:

<http://lynx.browser.org/> has lots of good info, and a ton of links.

<http://www.crl.com/%7Esubir/lynx/enhanced_pages.html> has a list of
'Lynx-enhanced' pages.

<http://www.anybrowser.org/campaign/> is the 'Best Viewed With Any Browser'
campaign, which makes a lot of sense (except that their server is acting
rather flaky at the moment..)

<http://www.cast.org/bobby/> will check your HTML code and offer
suggestions on how to make your web page more compatible with different
browsers, including Lynx. The site also has good suggestions on how to make
your web site more easily navigable by the handicapped.

Well, you can take your bloted pc crap and shove it were the
Sun Doesn't Shine! While I am running mostly Atari ST/TT/Falcons,
I am also going to put together a 8-bit system for some fun.
I enjoyed the old 8-bits. BTW, I run a BBS too, and you'll
not find any cracked software on it.

Black Hole BBS 14.4kb 805-256-9065 9pm to 9am PST.

actually, the 600XL does have a pretty easy 64K upgrade - it just plugs
into the PBI. No soldering at all. The were selling for about $20 not
too long ago.
also... the IDE interface on the PC is just a buffer and a decoder.
There really is no logic or intelligence involved.

Have you tried to say format the ramdisk to a lower drive number, say
drive #2 (or even drive 1?), and just copy everything over?

There was some utilities that even allowed booting off the RAMDISK.. I
dont remember a handy little swap command though.. but I did get some boot
disks running from the Ramdisk.. I can't remember the utility.. maybe it
was called RAMBOOT or something

Per attachment:

Atari 8 bit Inventory with estimated selling prices.

Except for books, all items in good condition unless noted with faults or outstanding.

Hardware:

1200XL CPU, $20
800XL CPU, 3 units, $20 each
600XL CPU, $20
400 CPU, in original box (box in fair condition) $20
400 CPU inop, if not repaired will go free as parts unit for above.

1050 Disk Drive, $20
Rana 1000 Disk Drive w/LED track readout, 2 units, $20 each
810 Disk Drive, $20

410 Program recorder, 6 units, $5 each

1027 Printer, $20
1027 Printer, missing small smoke-brown plastic cover, $15

1020 Plotter, $20

Atari Trackball EP443, 2 units, $10 each
Atari Kids Controller EP263 w/Big Bird's Catch template, $10

16K RAM Module CX853 for 800 CPU, 3 units, $5
OS Module CX801, 10K for 800 CPU, $5

XEGS Light Gun, $15

Parallel Printer Interfaces:

MPP 1100, $20
MPP 1150, $20
Axiom AT 846, $20
Ape Face, needs new Centronic connector (clamp on style, fell off ribbon), $10

Software:

Game Carts

Centipede w/docs, $5
Pac Man w/docs, $5
Star Raiders w/docs $5
Star Raiders w/docs, burnt ROM, runs from ROM dump on floppy, $5
Missile Command w/docs, $5

Disk Games

Blockbuster, shrink wrapped, $10

Applications

File Manager 800, $20
VisiCalc, 3 units, 1 near mint, 1 excellent, 1 near mint, box warped, $20 each
Homepak by Batteries Included w/docs, $20
Word Search: Spanish, w/docs, $10
Text Pro II/Data Pro II, no docs, $5
Atari Word Processor, complete in original binder w/lessons & audio cassettes, $30
Family Finances, near mint, $20
Timewise, shrink wrapped, $20
Letter Wizard by Datasoft, disks and quick ref guide, box fair, $10
File Manager+ by Synapse (predecessor to Synfile+), exellent, $20
Teacher's Pet classroom management software, excellent, $20

Program Cassettes

Touch Typing, shrink wrapped, $5
Kingdom w/ docs, $5

Programing

Atari Logo, cart w/docs, box bad, $10

Books

Atari Pilot for Beginners, $5
Atari Basic Reference Guide, $5
Atari Logo manual, 2 at $5 each
Atari Logo Reference Manual, $5
Dos 3 Manual, $5
How to Excel on Your 600XL and 800XL by Timothy Knight, $10
Inside Atari Basic, $5
Compute's Atari Basic Sourcebook, $10
Computers for Kids (programming), $5
Your Atari Computer, A Guide to Atari 400/800 Personal Computer, Including the New XL Series (THE Atari classic), $20

Buyer will be responsible for actual shipping costs only, from Gerber, California.
XL computers do not include OEM RF cable or 5 volt power supply. On request I will build power supplies for $5 to include with purchased CPU.
CPU's which do not have BASIC built in will include a BASIC cartridge.

e-mail: jkolak@jps.net
phone: 530-385-1697

All items must sell immediately. Items which do not sell right away will be sold to liquidation.

1929. Web access with an 8-bit. Re: Lynx

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-24 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6d0cvt$11p$1@newsd-199.bryant.webtv.net>
Source record: 65513

Interesting. If one accesses the internet with their 8-bit through a Lynx server, I am assuming that it is text only?

Is this access for the newsgroups only, or is it used for regular web pages, sans graphics?

1930. Netscape, Explorer setup vs. WebTV

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-24 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6d0dog$12p$1@newsd-199.bryant.webtv.net>
Source record: 65514

(Moving the thread)

Sure, any dolt could double click an icon, but dealing with Netmail, and the various settings are a pain. Then you gotta tweak here and there...

Gee, how many of you can _really_ get rid of Explorer, I mean get it off of your system, not just getting rid of the icon.

Then you wait an indeterminable time to connect to your ISP, if there isn't a busy signal...

Then if there aren't a ton of other users on the system, access can be a tad slow.

Don't knock WebTV until you try it. I used to access the internet before the WWW through a UNIX gateway, and also used an ISDN setup. Then I tried a WebTV box, and couldn't believe how simple it was to operate, and I was impressed with the speed of the graphics. With the exception of the Apple connected to a T1 line, this took the biscuit. And compared to spending almost $2000 for a decent computer and monitor, I got this thing when they first came out for a tenth of the price of a PC, plus you can connect it to a big screen.

1931. Atari 1029 printer

Newsgroup: comp.sys.atari.8bit

First choice: Epyx grip handle stick. There is a rare leftie version and
even a NES version if your lucky.

Second Choice: WICO.

Third Choice: TAC-2 w/ metal shaft. Awsome for pac-man.

There can be no others for me :)

Good news John..

I maybe doing a run on the SIO2PC in a few weeks, The Price would be $20.00
that encludes shipping in the USA. Fully tested and with SIO2PC software.

Ill be posting in a week or so in this Newsgroup.

Anyone Interested in a unit, Let me know asap.

Ok, sorry, I don't think I have it then, but I will keep an
eye out for it. I do have a SUPERDUP.SYS which is an
expanded DUP.SYS I beleive for disk access Dos's.

>Oh? So tell me, from BASIC, without going to the DOS menus, how do you
>format a disk? Now I'm talking about the standard Atari DOS 2.0/2.5

XIO 254,0,0,"D#:" will format a disk in the CURRENT density(single in DOS 2.0
and 2.5 though MYDOS, SpartaDOS, etc. will support double). If the drive is
configured for double sided, then it will format that way.
XIO 253,#1,0,0,"D#:" will format a 1050 or compatible drive in the enhanced
single density. If the drive doesn't support it, then it will either format
regular single or generate an error.
(oops, no edit...the XIO 254,0,0,"D#:" should be XIO 254,#1,0,0,"D#:").
These commands don't normally change the configuration.
Rick D.

1944. How to access emulator H: using IOCB, or need help with IOCB

What amazes me even more than the mechanical variation of drive speed (which requires additional time for motor speed stabilization) with the Macintoshes disk drives, is that the GCR encoding used by Apple vs Commodore. With Apple's method, 3 decoded bytes were obtained out of 4 GCR bytes. With Commodore's method, 4 decoded bytes were obtained out of 5 GCR bytes. Commodore's method yielded higher storage capacity with the exact same track length. The 1541, 1571, and clones all had 4 density zones (Zone1:1-18, Zone2:19-24: Zone3:25-30: Zone4:31-35). Electronically switching the data rate was not only faster, it also was incredibly reliable and stable from drive to drive. The older Apple][drives had a single speed zone, and had fewer sectors as you got closer to the spindle (which was why only about 100K of storage was possible vs. Commodore 1541's 170K of storage). Apple's 800K drives had 5 'speed' zones that varied from ~394 RPM to ~586 RPM. The higher rotational speed did yield faster data transfer. Apple's SuperDrives are unique drives. Since Apple's IWM and SWIM chips (disk drive controller chips) could only handle data at one rate (which is 1mbit for both GCR and high density disks), the drive is locked to 600RPMs when reading a low density MS-DOS formatted disk. This is similar to the Amiga's 150RPM disk drive setup except that with the Amiga, low density disks are read at 300RPM (not 600RPM), and high density disks are read at 150RPM (not 300RPM). Now, if Paula could have originally read data a 1us per bit, we would have never had a problem reading high density disks... but who knew in 1984 there would even be high density 3.5" disks?

Actually, there are a couple factors here to realize....

CD's contain around 74 minutes of audio wich is sampled at 44.1KHz, has 16 bits per sample, and is in stereo so it's times two. As far as raw data goes, they hold around 650MB. Anyway, keep in mind that the Atari cassette sounds are monural, and most likely need far less quality than 44.1KHz 16-bit. So consider making a wave file of an Atari cassette file; sample it at say 11200KHz, 8-bit, mono. After that ZIP your waves and watch them shrink big time. Play the waves on your PC and use the sound card output to feed into the Atari somehow.

My favourite is still my Wico Command Control (it's been working for 15+ years, with an overhaul every 3 years or so), which is the one with the red handle and the fire buttons on base and on top. Second choice would be the Wico Bat, but I can never get them to last and they're really hard to find now. I have an Epyx 500XJ that I don't like too much - you have to use your index finger on the fire button.

Taking the opportunity to fish for a minute: does anyone have either a Command Control or a Bat in relatively decent condition that needs a loving new home? I could offer trades, $$$, etc. My stuff is just plain wearing out and if someone has one sitting on a shelf in lieu of a different favourite, by all means let me know!

Regards,

Aaron

>
> 1. Does the tape recorder demodulate the tones on the tape
> and create digital data from it? (Or does the POKEY do
> that.)

Yes. Inside the tape recorder there are two filters and a comparatorthat
converts the two tones on the Atari tape to ones and zeroes.
These are then fed directly into the Atari computer.

But. Conversion from digital data to two tones. When you save data
on the tape. That conversion is handled by POKEY.

> 2. Does the tape recorder control the data transfer
> rate in the sense that it provides a clock line to
> the computer.

No. The datarate is determined from the first two bytes in eachrecord on
the tape. These first two bytes are hex 55 which corresponds
to a string of 20 alternating ones and zeroes. These butes are used
by the Atari OS to measure the bitrate that the tape recorder provides.

> 3. Relating to (2), does the tape recorder provide
> any other control signals to the computer?

No.

>Now he probably goes ape-shit over the Windows 98 beta.

HAHAHAHA That's "phunny". Well, in 1983 1200 baud was a "big deal"....

Like I said before, don't spaz out over this.... and notice I didn't say that web tv sucked.... which was the original point of your "snob" message... I just said don't overreact....

Oh please, not the pirate files arguement again.... let me tell you all something, I'm DAMN GLAD that I HELPED put Atari 8 bit out of business - the people who whine and complain that the pirates killed the market couldn't be more wrong that the reason was that. The atari 8 bit market died because NEWER and BETTER stuff was coming out. Do you expect that the whole world would be happy using a computer designed in the 70's? Can you imagine running todays bloated software on an atari 8 bit? I'm amazed that what's being coded in the 90's is so amazing, mostly in Europe, for the atari 8 bit. But those programmers have to work hard to squeeze that performance out of the box, and that in itself is very impressive. *BUT* the mainstream "mob mentality" dictates (yes, DICTATES) what platform is most popular... and this is bloat-ware pc crap.....

Would this work on any other computer too?

Or what I really want to know:

If your computer is already internally memory expanded, would an external memory upgrade work too. And how does the computer know when to select internal and when to select external memory.

Howdy Linda

I like the CX40's. You can get repair sets for these at I guess B&C, Best and American Technavision. But make sure you got the right set. They have "PC board", "handle plus switches" and kits like that.
I'd recommend against the 7800 type joysticks. I really hate them. But the 7800 joyPAD is cool. SEGA joypads seem to work too.

Ernest,

> All this, and everything else about tapes that nobody
> really cares about is in the documentation that comes
> with the wav2cas program that can be found at the
> Umich archives. Sometimes it pays to read the
> documentation.

You are right. The big report type of document you have put
in the wav2cas.zip package really seems to cover everything
related to the Atari cassette/datasette handling. I
am very impressed with the research you have done.

To summarize this Atari tape loading thread that I
initiated: Thanks to all who responded for valuable
feedback. WAV2CAS rules.

Anders

PS. The reason to why I did not look at wav2cas.txt first
was that I had a problem with my unzip utilities, they
report CRC errors for that file. I still have a
problem with damaged text at the end of the document,
but I suppose that is due to my zip utilities.

Message-ID: <34F4505F.1300@sympatico.ca>
Source record: 65439

I hope someone can answer my question, I bought a floppy drive at the
local thrift store for $4 (CDN)...
it looks like it is for the Atari 8-bit...as it has the Atari SIO
connector on the back...
the drive says TRAK at-d2 on the bottom...
My questions...can I use it with my 130XE/800/65XE...& if so, what
voltage transformer is required (it was missing) & if the power supply
is DC what polarity?
and a last question...is the drive any good...
I have a couple of 1050's & they work fine...

thanx in advance for any/all responses!

There is an /EXTSEL Signal on the PBI. It signals the computer to disable the internal RAM.

I have about 1000 new joystick guts for the CX40. Not the PCB and cable, but
the white plastic insert that gets cracked and mushy after awhile. Got
lucky at an old Atari dealer awhile ago. If anyone needs one just let
me know, you can have some for a large SASE.

1980. ANNOUNCE: program to make disk images

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-25 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6d1rls$1d3$1@dartvax.dartmouth.edu>
Source record: 65454

Do you have a bunch of Atari files that you would like to see
incorporated in an ATR disk image file? If so, then I have a
solution:
unix2atr
Available from:
http://www.cs.dartmouth.edu/~crow/atari/

As the name suggests, it's designed to run under Unix, but I see
little reason why it couldn't be compiled under other operating
systems. Features supported include:
Single or double density sectors
Arbitrary number of sectors
upto 1040 for DOS2.5
upto 65535 for MyDOS
VTOC bitmaps in DOS2.0, DOS2.5, or MyDOS format
Convert filenames to uppercase (or not)
Include subdirectories with MyDOS format images

Currently missing features:
Update boot sectors to recognize DOS.SYS
Update boot secotrs based on drive parameters for MyDOS
Support for DOS2.0D

Currently, it's version number 0.8, as I need to get the boot sectors
right for version 1.0. Any documentation as to what I need to do
would be very helpful. For now, I suggest booting with another image
and using DOS to write a new copy of the DOS files, thereby updating
the boot sectors.

I also could use documentation on what the first byte of sector 360
means.

Bug reports and patches are also welcome. If you want SpartaDOS
support, you'll have to write it, but I'll be happy to incorporate
your patches.

If someone compiles a DOS version, please send me a copy of the binary
and any changes you have to make in the source.

Source record: 65455

About 1 1/2 years ago I got a letter from Emulators Inc
(www.emulators.com) to get a free upgrade from my version of Xformer to
the new Windows version, Xformer96. I sent off my self addressed mailer
and postage and never got anything back. Well, yesterday it arrived,
Xformer98. Haven't played with it yet, so can't comment. Has anyone
else gotten a copy? How good is it?

My other question is on another emulator, I thinks it's called Xlit.
Sorry if I botched the name, but I haven't played with it for a while,
and the reason is it runs too fast. I'm guessing it runs twice the speed
of a real Atari. Are their any good ways of slowing my computer down?
I don't have a turbo switch, and do not want to open the case to change
the clock speed. I'm hoping for a software fix that will evenly slow
things down, not totally hog the computer then go etc.

I'd like to know which Atari 8 bit emulator for PC (DOS or WIN 95) is best.

> about it business?

If you run it under a multitasking system like Windows95 then you
can do other things, but the performance will be degraded somewhat.

APE will run on pretty much anything, even a plundering old 8088. You would
have to turn off all the screen updates and such, but it would work. If
you dont want to tie up your regular computer, a $5 thrift store
or boot sale computer makes a nice server.

I even ran APE off one of the original 808? ps/2's for awhile. Nice little
beast with its own monitor and 20 meg hard disk. Paid $4 for it
at a thrift shop.

>Also can the APE system use either of the COM ports on the IBM?

Sure, it will work with any base/irq combination, just set the correct
port in the configuration.

Steve

>
> a dot matrix printer

If he already has an 850 interface or other printer interface then just pop into a thrift store and get a dot matrix printer for $2 or so, every place has tons of them. If not you can get a APE face or other dedicated printer interface from most of the remaining Atari dealers for about $10-$20.

I have a bunch of old APEFace/MPP printer interfaces lying around here Ill sell on the cheap. Seems like everyone had one of these way back when, and every system I buy seems to come with yet another.

> a usable disk drive
> a good disk operating system for a non-technical person

I see most people dumping stock 1050's for around $20 here, more if you want something high end or enhanced. For papers I cant imagine a stock 1050 not doing the trick.

You cant get much simpler than Atari DOS 2.x. If you want a more msdos like product, then try Spartados. If you dont plan on being able to download software from the net to the Atari, make sure the person who sells you the drive gives you a DOS disk as well :)

> and an 80 column expansion

The only 80 col expansion besides the XEP-80 im aware of is the Omniview. I got a few of these on my ramrod boards from Newell before they sold out. I cant stand to stare at that pink screen, but it is functional at least. Its only compatible with programs that use the CIO routines and dont write directly to screen memory.

If anyone knows who is selling Newells stuff please yell. I heard Fte got the rights, but thats a dead end.

You might also want to upgrade to 64k at least. A few dealers have the MPP or Atari PBI ram expanders for $20.

Enlighten me...

What does it matter today, now that the 8bit is of a bygone era, whether software is an "illegal" copy or not? I am resurrecting several 8bit systems (and purchasing more, mind you), in order to take advantage of great hacks like SIO2PC, and APE. If there was not a plethora of freely available software (games), I would have turned my interest elsewhere. In this respect, one might say that the piracy of Atari software has led me to further support the few remaining sources for 8bit hardware.

Correct, but that's no problem for Catweasel, as it already can deal
with the Apple and CBM formats you mentioned with varying data density
on outer and inner tracks. Yet the track stepping, it cannot control.

Oh no... those were really available cheap at Odd Lots? I wondered why
I happen to see so many sellers advertising these for sale. I paid some
good money for a set of 10 different diecut hanging posters a couple of
years ago. I am too embarrassed to say how much I paid to get them.
The Yar's revenge one looks very cool though. Oddly, out of the 10
different titles I have, one is TEMPEST, which seems odd in light of the
fact that Atari never officially released the 2600 Tempest prototype.

I don't know how much work you do with ICs, but Maxim/Analog/Harris makes a whole line of 1488/89 replacements which can be powered just by the 5v pin in the serial connector, giving a one chip solution to the tx and rx lines into an Atari from a PC. The chips are available via JDR, Jameco and Digikey- they're cheap and work very well.

Funny about mail order experiences, our company orders lots of stuff by credit card and PO from both JDR and Jameco and never have had trouble....

I don't know the design of the SIOPC cable, so this might be a nonsense posting.... If so I apologize.

Okay... $20 or $25 plus shipping may sound cheap to you, but we're talking college-student terms here. I am interested in the reply from Rick D. that involves changing a couple of chips. Surely, these can be had for less than $20. In fact, I bet shipping will cost me more than the chips. I once ordered a part to replace the broken door hinge on a walkman several years back. The part set me back $0.45 and shipping was $4 (it had to be ordered from Japan). Ridiculous.

Thanks for the input, however. I like the spirit of the Atari community. Good to see.

>thing when they first came out for a tenth of the price of a PC, plus
>you can connect it to a big screen.

I connect my pc to a 32 inch tv, it is not just a WEBTV thing

What do you have to do to upgrade to 56K, and do you have problem viewing some web pages (I have heard from others there are a few problems on some pages) Does WEBTV have brower upgrades? Since microsoft bought WEBTV do you have a microsoft web brower? Would you happen to know what CPU is inside your WEBTV? How in the speed on big java web games? Does WEBTV provide web page space, and what do you pay a month?

if any one cares ONE NET charges 17.95/month unlimited time, 60 meg webpage space

WEB TV is a nice idea, there is just no way you can say WEB TV is better for the internet than a pc.

btw this is a ATARI newsgroup not a flame war, this is my last message on this topic

PS I would really like to know the anwers to my questions, I'm not being a smart ass.

Nothing! That's the excellence about it. I did not realise myself that it worked like this. Just plug the cable into the SIO port of the Atari and into the COM port of the PC. Start the APE program on the PC and load a disk image there. Then turn on the Atari and it boots from the PC. Rate this as one of the best HW devices I've seen. Take Atarian care

Anyone remember Astrowarrior? Perhaps my favorite. For all its simplicity it was just too fun. It was essentially "Asteroids" class ships pitted against each other, only with shields and various levels of damage. With four players at once, it was the best. Of course all players must hold a salute during the opening Astrowarrior theme song!

well I can't help you with your SpartaDOS question, as I've not used
SpartaDOS much, but if you would consider trying this with something
other than SpartaDOS (MyDOS, Atari DOS 2.0/2.5...) then maybe I can.
You might want to check out my ramdisk program, which will do pretty
much what you want, letting you reference the ramdisk as D1: and your
real drive as D2: (or whatever) without having to fiddle about with
the switches on the back of your drive. You could even have it
copy the files you want onto your ramdisk automatically. The catch is
that the program needs to use the RAM under the OS ROMS in order to
work, and as I understand it, most versions of SpartaDOS also use this
RAM, making the two incompatible.

If you need to use SpartaDOS, then... pass...

If you're interested, then my ramdisk program can be found either on
the umich archives under Os/ramdrv10.arc or on my web page:
http://www.co.umist.ac.uk/~rje/8bit/atari.html

re: WWW with an A8...

You can pretty much go anywhere on the Web with an A8. Text only, however, as Lynx doesn't support graphics or sound. There was a lynx server (Panda) that allowed Zmodem downloads from an FTP site. Haven't been able to access it for months, though. This is why I'd really like someone to write a TCP/IP handler. A friend has already promised an IRC client when the handler is written. I'm sure that a Web Browser could be written with some graphics support (monochrome GIF). An alternate route would be if Tom Hunt would modify CGS so that we could access our own Web pages that used CGS. Wouldn't that be a switch? A PC user would get to one of our sites and it would say 'Best viewed with CGSBrowser' or something like that, and they would have no idea what that would be...

re: want to buy rare atari things...

Wow. You're not asking for much eh? =)

I have a couple of the Pongs, the Video Pinball, the Video Olympics, and the Stunt Cycle. I knew someone that has a Video Music system, but he wouldn't sell it for anything. I'd like to get my hands on one of those! Would probably be the hardest thing to find, along with the Game Brain. I even remember going to an Odd Lots a few years ago, and they had these posterboard-like material promp items that you hang from the ceiling. Like Centipede, Missile Command, etc. Like an Idiot, I didn't get any of them. Silly me, I thought Atari would last forever... =(

BTW, I can't sell any of the stuff listed. I got my stuff by getting lucky at HamFests and garage sales. I even found the board/joystick assembly for a 2600 kiosk. $10, a
and it works!

2015. Re: Web access with an 8-bit. Re: Lynx

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-26 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6d3943$3bg$1@newsd-199.bryant.webtv.net>
Source record: 65474

Hmmm. I think that text is about the only thing one would want to do with an 8-bit. To even tell the poor thing to display a big JPEG or even any kind of sound file would take forever, wouldn't it? I mean, it's still a 6502 running at 1.7MHz... I use used to do alot of GIF pictures and it wasn't speed demon then.

So anyway, does it utilize the XEP80 or other 80 column device, or does it emulate 80 columns?

On the other hand, I would expect most of the users here to use some type of IBM or Apple computer.

2016. Using the 64k expansion on an 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-26 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6d39g3$3bn$1@newsd-199.bryant.webtv.net>
Source record: 65475

Plugging in the 64k expansion for the 600XL into an 800XL will get you... only 64k. When you plug in the module, it will disable the internal RAM.

It's like plugging in the BASIC revision C cartridge to replace the built-in revision B.

2017. WebTV (yeah, it's not Atari...)

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-26 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6d3aol$3cg$1@newsd-199.bryant.webtv.net>
Source record: 65476

I never said that WebTV is better than a PC. For some users it might, for others, might not. Same reason that an Apple might or might not be better than an IBM for some things...

In any case, Microsoft may own WebTV, but they do not have their sticky little hands in it. It uses a proprietary browser, but it is mostly acronym compliant. (HTML 3.0, Real Audio, Shockwave, frames, Javascript, blah, blah, blah)

Upgrades are automatic, sent over the phone lines when you turn it on. They absolutely will not crash. The display uses proprietary hardware and software to optimize the picture for a television, and it works better than most of the scan converters for PCs.

33.6 bps for the Classic, 56k for the WebTV Plus. Expansion port, Smart Card slot, S-Video, stereo audio, uses IBM keyboards, an infrared keyboard that really works...

It uses a RISC processor. The Plus has a 4Gb hard disk, parallel printer port, picture-in-picture capability. On and on.

There's the WebTV site for more information www.webtv.net.

2018. 1982 Atari Home Computer Product Catalog

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-26 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6d3c30$3dc$1@newsd-199.bryant.webtv.net>
Source record: 65477

Rummaging through all my 8-bit stuff, I found this catalog I must have gleaned from an Atari dealer back then.

For collectors information, this is a four-color catalog on slick paper, with a large Atari logo in rainbow colors. 34 pages, it describes in detail current hardware and software, and the catalog numbers for the software.

Primarily focusing on the 400 and 800 computers, it shows the 810, 410, 830 acoustic modem, 822 thermal, 820 40 column, 825 80 column printers, and an 850 interface.

Does anyone know about the Calculator program (CX8102) that is in here? I don't recall ever seeing it.

I also have another 1982 catalog, when they were starting to transition to the XL line. This catalog is silver, but with red horizontal lines. Mainly a big Atari brouchure, it tells prospective customers what you can do with your Atari computer.

Mainly 400 and 800 computers, but there are a couple of XL peripherals displayed.

The new 1010 recorder and the 1020 color printer are displayed with a 400, an 835 direct connect modem (1200 bps!), and a 410 recorder. Another display has the 800 with the 1025 printer and other peripherals.

This catalog is 33 pages.

Swozniak,
That is a VERY subjective question. I happen to like PC Xformer for what I use it for. many of the gamers here seem to prefer Rainbow. Your best bet is to find as many as you can and try them yourself. Tehy are all better at one thing than the next one. Different configurations (DOS used, mode used) can make a huge difference in performance. However, I haven't actually seen ANY that are 100% emulations of any REAL Atari 8-bit computer. They are all pretty close in many respects, but again, what I think is great, you might thing stinks.

This is not correct. mke2fs lets you choose the block size (1k or 4k IIRC). Linux supports a number of other filesystems besides e2fs, and e2fs is not linux-only anymore, so it's also not really quite right to talk about e2fs as "Linux".

On very large drives, larger blocks will give you better performance.

The Atari external 64K upgrade for the 600XL disables the internal
RAM.

I suppose it could be used to check an 800XL you suspected of having
bad RAMs, has anyone actually tried this?

Well, if it were legal to steal cars, I wouldn't steal them. Laws don't
determine what is right and what is wrong.

>http://www.atari-computer.de

Meanwhile, you can get an automatic, if horrendous, translation by using
the AltaVista Translation Service. Go to

http://babelfish.altavista.digital.com/cgi-bin/translate?

Type in the URL Matthias gave, above, and hit the pulldown menu and select
"German to English." Then hit the "Translate" button. In this instance,
AltaVista puts up a second page complaining about frames, but lets you
click on the URL of an individual FRAME and feeds THAT to you as a
non-framed page. Matthias' page is in German, but you see it in English.
More or less, anyway -- it's a pretty poor translation, but you DO get the
general sense of what's being said.

All in all, I'd still like to see the human-translated version as soon as
possible, Matthias! :-)

old video cards for the pc are good dram sources for the 600xl
upgrade, others can be gotten from Nuts&Volts mag ads or possibly
older pc motherboards that used the 256k x 1 drams. I have a couple
here.

It's unlawful to J-walk too.... damn I must be a rotten person because
I J-walk sometimes. Another thing, I have known quite a few
anti-pirate soapbox types in my time. Do you know what, every one of
them was guilty of accepting commercial software they did not pay for
at some point; usually more than once. So, strictly going from
personal experience, the thing I have to say to most of you on the
anti "piracy" high horse is... GO BLOW IT OUT YOUR ASS. And also a
minor point of distingtion I think people should note: PIRACY and
ILLEGAL COPYING are not one in the same. Piracy is illegal copying
that is for profit. An example would be some place in the Asian
Pacific rim reproducing Microsoft Windows and selling it for profit.
Joe Blow and Elmer Scrub trading a couple of programs with each other
is cheating those who hold copyright to those programs, but it ain't
piracy on the high seas, and it isn't something so terrible that
certain people need to condemn it like the black death itself. And
you damn well shouldn't be condeming like that, UNLESS YOUR LIFE IS AS
SQUEAKY CLEAN AS A NEWBORN BABY'S ASS (actually that could be messy
but you get my meaning hehe). After all, these high horse people are
a lot more concerned about copyright to these old, forgotton by most,
programs for our wonderful nostalgic 8-bits than the copyright holders
themselves seem to give a rip. God it puts a bad taste in my mouth.
I mean, it seems to have a similar flavor to the Hollywood brats that
think they need to save the world from itself because it makes them
feel important, riteous, useful, or in some other way helps feed a
part of the ego that was lacking enough attention. I get a real
similar vibe there. Makes me wanna' puke.

Regards,

Jon

> else gotten a copy? How good is it?
>
I got it, too. I haven't played with it much.

Supposedly, the sound now emulates a real POKEY. So, how come my Creative AWE-32 chokes on it (intermittent sound) but not as badly as the stuck notes I used to get with previous versions until I actually powered down the PC and restarted it? I guess the first thing I have to try is to put the AWE-32 into Sound Blaster mode and see if that helps.

Also, according to the docs, you can't get full-screen performance in Windows 95 unless you have version 5 of Activex. I still have to download that, so I won't be able to tell.

Third, and probably a major glitch, if I want to change drive assignments, pushing the "change" button gets me a "wait" mouse cursor and nothing else. Something's up, and, again, I really need more time to check it out. If nothing I do can change it, I'm going to let Darek know and see what he says.

There are good things to say about the program. All settings can be handled through a pull-down on the splash screen. Speed seems to be pretty good. The OS and BASIC seem to work well (even POKE 755,6 works!) and this is the only full-machine emulator to date that will support printers and serial devices. And yes, it does work under Windows 95, and reportedly under NT and Windows 98 as well.

But a full report on my progress with it will have to wait a while. I'm essentially snowed under at this point.

I think that getting pictures displayed while on-line is only one part of the problem. You could, of course, get around that by downloading the picture files, but with our 19.2KBaud limit (9600 for many) that would also be a hassle. Maybe some attention should be paid to allowing faster modem speeds through a new interface and some buffering?

I quote Denis Bishop where ">" are seen:

>Everytime a copy is made and even just traded, it takes $$ from
>the person and/or company that sold the software in the 1st
>place.

Wrong. That only happens when a) the software is still made available for sale, and b) the person getting a copy would have otherwise purchased the software had it not been for getting a free copy. Obviously, with most of the old Atari8 software, it IS NOT available retail. A small smattering perhaps but by and large not. Of the little bit that is left, I venture to say most people these days would not be interested in it so much as to actually shuck out any kind of much money. Perhaps interested enough to take the time to get a copy for nostalgic purposes but beyond that there would be little to no interest. Now despite what attitude you may have about me, it may surprise you to know that I am neither an idiot nor am I a thief. Let me try to clarify my stance(s):

1) I have no problem with copying old stuff that isn't for retail sale anymore. I do however, believe in supporting current stuff like Rainbow, APE, etc. Who the hell cares if I get a copy of Dog Days? If it were for sale I would not buy it even if I could not get a copy. In fact, when I get some things in order around the house and get some more time to fiddle, I plan to bring out my old 800XL and look into SIO2PC or APE and such. I also plan to maybe purchase Rainbow & XFormer98 depending on how well they really work in their full versions.

2) I do have a problem with hypocrites and or those who live in glass houses throwing stones. I also don't like people trying to make a capital case out of something I consider to be pretty minor. Just because something may not be to the letter of the law does not make it a mortal sin. J-walking is against the rules you know. It really is. But I bet you don't have a problem with it so much do you?

>When ever I've gotten a system from someone, I check
>out the hard drive, most of the time they are loaded with
>programs, if it's software I had already paid for before, I
>just delete it, but if its software that I don't have and I
>may want to use, then I send a letter to the company/person
>with a $10 check. Most of the time I get a thank you letter
>back and they have changed the reg. number over to my name.
>A few have sent back the check and say I have to buy a new
>packet of software, if I like it, I do just that after I've
>saved up for it

You just shot yourself in the foot. In order to be FULLY honorable (as you apparently like to fancy yourself), you should delete ALL software for which you have no license or right to use, then legitimately purchase it and use it only then. You send a $10 check. May I ask what the hell that is for? Is that what you decree is fair payment? What gives you the notion that you should somehow weasel out of paying the TRUE fees? Ahh, of course, because you are a crusader of justice and deserve to be given a break, while at the same time you are criticizing anyone else who dares try slip through without paying what's due. Your a "good guy" so you have it coming. You are a special breed. You are riteous. You lean towards the Hollywood brat savior of the world notion I was talking about, and you certainly fit the living in a glass house whilst throwing stones. Look, if you want to be so damn riteous then you have to be squeaky clean. You are not. If you want to be just a cut above those who copy all kinds of stuff no matter, then fine, be that. But do not try to come off as Mr. Snow-white because you are not. I do not have to be subjected to your judgment. You are not my master, nor the master of any of the others in the group.

>I ran my own company for awhile, and I
>am still a Calif. Retailer, so I treat the software the
>same as I would want people to treat the things I sell.
>I've also been a sysop since 1989, and during that time
>I had users who did u/l cracked files, as I was the ONLY
>person who could valadate the files, I would find them,
>delete them and tell that user that they were not to
>do that again or they're account would be deleted.

I would have done the same, but I don't pretend to be the LORD OF ANTI-PIRATING, cuz' I ain't that either bud. I'm as guilty of getting copies as I bet MOST of the people in newsgroup are. I have bought plenty as well way back. I've never sold software. I am unable to buy almost all of that old 8-bit software anymore, nor would I be willing to pay very much if it were available. If it's something I want, and it's readily available for retail sale, I will buy it if it's worth the money. If it isn't worth the money I won't get it at all. If it's old and not being sold, and I like it, I will take a copy from anyone who cares to make my day and I will thank them for it. And that's about as much justifying of my beliefs as I'm going to give you because I don't owe you any reason.

>There was a guy at a Atari computer show that had a game,
>he sold 1 package of it at the show, by the next day
>it was on the west cost as a cracked program on one of
>those stinking Wearz BBS's. He droped the Atari computer
>market because of that. So in the kind of words you enjoy
>using and can understand ...

>Stick your head up your ass and fart and blow your brains out.

At least I seem to have some brains that can be blown out. Let me ask you something. Be honest. Have you EVER, even once, accepted a copy

of commercial software that you did not pay for in a legitimate way or even not pay for at all? For the purposes of my question, a "legitimate" way of paying is to buy at a store or retail vendor of some type (including the producers of the software direct sales too). Illegitimate payment is.. "well, I gave So and so some disks or a few bucks to get that program."

Please tell the truth. Of course I will have no way of knowing if you do, only your own honor will know.

You know, perfectly useful 486/33 clones can be had for as low as $150 if
you know where to shop. As can older Macintoshes (like IIcis and the like).
Find a cheap color monitor (in the $100-$200 range), hook up a $150 modem
(which you might already have, hooked up to your Atari), and voila. 256+
colors and no need to build special hardware, emulate 80 columns, etc.

Just a thought. :-)

I think you're missing the point here. Any idiot can browse the Web with a
PC. One need only look at all the ones doing it to see that.

To browse the Web with an Atari 8-bit takes a special kind of idiot - one
who likes a challenge.

So tell me, are you just any idiot, or are you, like me, something
special?

I'm something special, too. I regularly use MacLynx (which is funny, when
you think about it).

I get impatient looking at web pages on my PowerMac; I can't imagine
enjoying the experience on an 8-bit atari (more than, say, once).

What you have is (on a 400/800) a set of 4 I/O pins. Each pin can be configured as input or output. Electrically, you need something which takes a TTL level hi/low and uses it to drive a relay. That is a pretty easy to build circuit, Radio Shack has a series of electronics experimenter booklets which contain appropriate circuits- use something which interfaces "logic" to a FET driving a relay. The Atari joystick outputs don't supply a lot of current, so you need some circuit which doesn't require much. You also might consider some of the mail order operations (All Electronics, Jameco, JDR) many of them have digital I/O kits or gizmos which might do the trick.

You might also want inputs, where the Atari can detect a switch closure. In that case, the simplest thing is to use your switch to operate a relay, then feed the contact closure back to the Atari the same way the joystick does.

Remember you can also use the trigger inputs to monitor switch closures, and the paddle inputs as pseudo analog to digital converters; ie; build a robot with potentiometers in the joints of the articulated members for position feedback thru the paddle ports.....

As far as configuring the pins, the Atari Hardware Reference manual (available lots of places online, Altavista will scrounge it up) has specific details. Generally, there are a couple memory locations relating to the joystick ports, one is a data port where you read pin levels and write new ones. The other port allows you to set whether a given pin is input or output.

My dad controls a seimograph and low frequency radio receiver with 2 Atari 800s via their joystick ports- it works very well. As a sidenote, both 800's share the same 810 (both hook their serial bus cables to it), he syncs them at bootup so they don't both attempt I/O at the same moment- and it works...

Good luck, and be careful- 120 volts into you or the Atari will be disasterous!

>Can ayone supply to me-
>A list of the XIO commands, particularly the list directory (or
>how to get the directory in BASIC-I used to have a little menu program
>but I lost it.

Depends of course on the emulator, but David's atari800 doesn't support
any XIO commands for the H: device driver.

If a directory listing is supported depends mainly on the compilation
parameters, but if it is available, you can read the directory from basic
with a program like this:

```
10 OPEN #1,6,0,"D:*.*"
20 DIM A$(40)
30 TRAP 70
40 INPUT #1,A$
50 PRINT A$
60 GOTO 40
70 END
```

>Also if anyone has used the IOCB to binary load from H: drop me a line

See my followup below.

2052. Re: Atari 835 a 1200 bps modem?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-27 00:00:00 UTC
From: dwmoar <dwmoar@teleport.com>
Message-ID: <34F7021D.AF4BF669@teleport.com>
Source record: 65537

I had to check this for myself, and yes the 835 was a 300 baud modem.
Perhaps Atari had given thought to making it a 1200 baud unit. I talk to
several people about the 835 and they all said the samething. 300 baud
only. I do also know some of the BBS here on the west coast that still
let 300 baud users connect to them.

If it were me I would use the port to gate a SCR that would in turn drive a control a triac. I would want to make sure that my Atari was isolated from the 110 volt source though. Just in case something went wrong (like a short) Would hate to fry my machine. This could be done through an optic isolator. I am also assuming that you are only going to use the ports as an output device ? If you would need help designing this type of circuit, I would be more than happy to help you with it. If I remember each port could support upto 4 of these type of controllers. Perhaps more if one multiplexed the control signal output. Anyway just a thought.

I thought I remembered hearing that CTIA provided 128 distinct colors,
and GTIA provided 256 distinct colors (along with new graphics modes).
Is it true that there was a difference in color generation between the
two chips? (BTW, my 800 has CTIA, making me a certifiable old-timer.)

2055. software compatibility checklist

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-27 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6d70ra$t91$1@dartvax.dartmouth.edu>
Source record: 65540

I'm thinking of making a software compatibility checklist; something
that could be useful for checking to see what hardware (or emulator
mode) is needed for a given piece of software. So far, I'm thinking:

Will it run with:
800
1200XL
800XL
130XE
NTSC
PAL
CTIA
DOS2.5
MyDOS
no DOS
8K?
16K?
48K?

I'm mainly interested in binary load programs (mostly games). So for
the DOS compatibility, I'll call it compatibile if it will load from
that version of DOS. I didn't inlcude the 400, 600XL, or 65XE as I'm
assuming that their only significant difference is memory. I listed
CTIA but not GTIA as I assume that there are no programs that were
CTIA-only.

So how does that list look? What else should be added? My thought is
to reorganize the megaimages with a text file listing the contents
with the checklist (initially mostly question marks for things I
haven't tested).

(from the .txt file)

Introduction

Many years ago, APX released a program called Envision. It was THE game design tool. It had an integrated character editor, map maker and many other useful utilities. Having recently returned to the Atari 8-bit scene, due mostly to the high quality emulators now available, I felt like pounding out a quick game. I scrounged around for a copy of Envision--and was rather surprised to be unable to find one.

As such, I set out to write my own version. However, this time it runs on the PC (either Linux or DOS/W95). I can already hear the gasps of horror. Why write a design tool for the 8-bit that runs on a different platform? The answer is twofold: first, it is useful to switch between applications (i.e. the Atari Emulator, and EnvisionPC). Second, this type of editor begs to use the mouse. Since I haven't seen an emulator that uses the mouse--and since my Atari ST mice are all dead, I decided to write this as a cross-platform tool.

Features:
* Full featured Character/Map editor
* Work on 10 font banks at the same time
* Supports ANTIC modes 2,3,4,5,6,7
* Export fonts to BASIC, MAE, MAC/65, Action! data formats
* Initial .XFD support (may be buggy)
* Binaries for DOS/W95, and Linux
* Full source code included

EnvisionPC: Release 0.5

This is a font/map editing program similar to the old Envision program on the Atari 8-bits. It runs on an IBM PC (either Linux or DOS/W95) and includes all source code.

This is from Mark W. Schmelzenb, schmelze@ursa23.cs.utah.edu

It should be at UMich under Graphics/Editors

>The RESET key
>causes a NMI (via the ANTIC,I presume) and no key code.

If this is true, then how is it that I've got a routine that traps the RESET key, preventing it from doing a normal reset. Wouldn't it have to return SOMETHING in order to trap it? Or is it possible to trap it via the NMI, before ANTIC gets a hold of it?

I had some BASIC routines (actually, POKE commands if I remember right) that came from ANALOG mag to do this. There's also one to disable the break key in BASIC. Combined, I was able to write a BASIC program that was so unbreakable you'd think it was assembly coded. You know, the normal tricks to break out of a BASIC prog just didn't work.

I guess I just assumed that some kind of key code was sent since it's a simple command (relatively) to keep it from doing a reset. If anyone's interested, I'll try to find the commands in my pile of history.

Uhm, I don't know about the color-count, but that could be correct.
AFAIK the "only" (hardware-) difference between 800 and 800XL
series-machines
is the CTIA/GTIA-chip (adds GTIA-modes 9-11 ?)
(and off course, the OS is different ;-])

Source record: 65552

There is a page zero vector for the reset key- so its easy enough to route the call right back though a return. I think the call is precipitated by NMI however. The XL series fancied it up a bit, making the reset a bit more authoritative... Remember the 400/800 locking up so a power off/on was required, the Reset key doing nothing...? That vector was used to re-initialize hardware, the device table and lots of other stuff, but NOT user memory- so your program would still be there- the standard warmboot. If I recall, there was a POKE you could apply, causing the next RESET to coldboot the system.

The Break key is detected by K: (IIRC) and a flag set which E: acts upon. Basic might also test the flag also. There are a couple spots where you can suppress the keystroke.

As far as making things unbreakable, I did a little wedge into E: which would detect a break to READY and repond by stuffing the keyboard with RUN- it was a VERY annoying little routine actually.. ;)

Memory locations wise? Sheesh, its been way too long ago for me, but I'd be happy to try digging for them.

Lets give it a rest everyone. This has been addressed a million times in Atari forums and more in other forums. We all know the arguments by now.

I could see where this stuff would be of interest in the nintendo and sony forums where the kiddies are discovering piracy.

Oh, I have to laugh with you on that one -- I left the Shaft 2 years ago for a real job, so I know what you mean. The real kicker is that they've got just about all the parts you could need for most projects, but the employees are pushed to sell all the high dollar stuff, otherwise they won't get any commissions, so no one wants to deal with the "back wall" sales. Even still, I think the year I was there I only made about $8,000. Maybe that's because the tinkerer in me wanted to help the parts customers, so I lost out on the "real" money.

Linda, the main problem with the RS catalogs, even the "backroom" books, is that they're never reliable because parts manufacturers come and go. If you're looking for a part, and RS suggests a "replacement" number, it's usually because no one is making the part you want anymore. Of course, that's not really the drone's fault, but it definitely didn't make him/her look any better, right?

They say, "you've got questions, we've got answers." They never said they were the right answers.

Steven

P.S. I built the SIO2PC cable with a quad receiver from the Shaft, but I don't remember which one it was. Technically, it only needs to be a dual-line receiver, but I don't think they make one. I don't know if RS has more than one type of quad, so you can probably make it work with whichever one they have. Don't quote me on it, though... I used to work there, you know ;-)

>diagram for the thing so I can put a new cord on it?

Since you have one just make your own wiring diagram. If the
conductors in the cord are color coded it should be no problem. All
that is needed is disassembly of the main unit to see which color
wires go where on the board. Then cut off the very end of the cord
(the end with the plug on it). Using a continuity check, determin
which color wires go to which pin assigmnet. Now you know which pins
go to which areas on the circuit inside the stick housing, and that is
the wiring diagram you need to make a new cable.

What the heck does it matter if you are a 300 baud user of something faster. Most "private" bbs give you a time limit usally. So what do they care if you logon to the BBS at 300 baud or faster? a time limit is still that no matter how fast you are going at. Face it some people have no desire to buy anything faster.

The Atari 835 is a 300 baud ONLY modem, however the software cartridge: Telelink II did have an option to switch between 300 & 1200 baud even though the hardware wasn't able to support it. What may have been happening is there may have been plans for a 1200 baud modem, but they may have fallen short of time or it would have been too expensive at the time. I heard at one time about an Atari 837 but I have never been able to confirm this number designation either through conversations with ex-Atari engineers or in any of the engineers manuals I've gone through so this may have been just a rumor or nothing at all.

For IBM disks you need a Happy drive that's been re-programmed.There might be other drives out there but they need 512 bytes plus however much RAM the patch programme takes.

The other computers you mentioned use the GCR (and others?) disk format instead of MFM (and FM) like Atari and IBM use.So just forget about them.

Just speculating here now but... perhaps it's because Markus considers development "paused" rather than "stopped." Maybe he entertains notions of getting back to it when he has the time to do it, as far in the future as it may seem. If he ever will get the time to work on it who can say. Maybe I'm way off target. But it certainly is his descision. Markus are you watching? Care to comment?

It should have come with DOS-XL which has a thing called gtsync.com - that
makes it run at 3X normal speed with disks formatted in dos-xl.
I think there is a way to make it go fast in SpartaDOS but I don't how.

>Unless you want to spend lots of time with floppies again :)

(this is gleaned from the FAQ)
If you can get a hold of a Speedy 1050 upgrade you can upgrade your 1050 drive
to go much faster than a US Doubler 1050 or APE.
USD1050=53200,APE(reading)=57600,APE(writing)=38400,Speedy 78000 baud.
If you're using APE with a hard disk drive or disk buffer software then that
counts as a built-in track-buffer.So that'd make it a little faster (%10) than
a Happy drive.(presuming Happy drive go at 53200,like my Duplicator clone)
I assume it also gives you double density.

Someone mentioned that he got 96000 baud out of some drive.
(I thought he said the Speedy 1050)
And the Karin Maxi PBI floppy drive gets 11.25 kilobytes per second.
I use a P:R:Connection to download the files from my IBM to my Atari.
You might try MYUTIL to write the files out to a MyDOS or SpartaDOS disk.

>I need this for an emulator enhancement.

It's realistic for Ultima and it's ilk.But StarFleet messes up because turning on artefacting in XL-IT causes the foreground colour to be set to bright white. Since StarFleet uses a background colour (un-affected by XLIT) of off-white it's nearly un-usable.While other games are still playable they may not look that good.

>>create a image with 2 more sectors than you need.
>> (this applies even to the new 1.16 version)
>Why will the last 2 sectors 'be useless'?

How the hell would I know;you made APE.
But a ATR created by APE shows up as having 718 sectors instead of 720.
You can test it with PC Xformer or Ken Siders' ATR software.
http://ourworld.compuserve.com/homepages/ken_siders/atari.htm
His ATREXTR will list the ATR as having 718 sectors.(instead of 720)

I wanted to test it with XL-IT but Diskcomm is WAY to slow under XL-IT and
VTOCFIX doesn't work because XL-IT drives aren't configurable and VTOCFIX can't
understand a non-configurable drive that's double density.
(i.e.all double density drives in Real Life(TM) are configurable)

The problem only shows up in 256 bytes-per-sector disks.

Sure have... on XL-it!, on a 486-75. Game got easy to the point where
I was able to destroy all 40 spider larvae easily, which made part III
(the necromancer/tombstone area) spirder-free. ;-) (save for the
mother spider)

Anyway, it does just what it says it does in the manual... that is,
the screen (forest) flashes into a rainbow of colors upon destroying
the necromancer. Nothing big, but nonetheless rewarding (i'd imagine
on a real 8bit, on which the game is much harder)

I hate to burst your bubble, but the 600XL DOES NOT use 256X1 memory chips it use 2 16X4 chips. to do the internal upgrade replaceing the internal memory would require 64X4 K chips (2 of them) I doubt that you will find these on a old IBM motherboard or on the video card. Actuall Best Electronics should be able to supply them if need be. ($2.50ea)
For $20 or so dollars you can buy the 1064 (64K) plug in memory module. This was designed by Atari itself. There are a few hacks that can be done using a standard 4464 chip, but this can get spendy. $2.00 a pop for the chip time 8 plus you hacking your machine - more than you would pay for the 1064 plug in module. Hey it is only a thought. If you need the upgrade for docs for the 64K upgrade. Drop me a line, and I can e-mail them to you.

where is it written that IBM was a speed deamon? Shit for the piss poor programs (sloppy written ie. windows) it has to have a fast processor to make it even look good. As far as graphics it isn't all that great itself. It is a shame that you have to compair apples to oranges and web tv to the internet. By the way if Microsoft owns WebTV that it has it little sticky fingers in it, you can bet on it.....

2095. Atari 835 a 1200 bps modem?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-27 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6d63o0$58l$1@newsd-199.bryant.webtv.net>
Source record: 65624

Well, in the catalog, it says here:

Operational rate: 300 or 1200 bits per second.

The 830 acoustical modem was a 300 bps unit, but it says here the 835 direct connect had 1200 bps capability.

Now, I really can't confirm this, as I do not own an 835. (I ended up getting a 1030 back then) A typo? Hell, I'm not even sure if you can even dial a BBS and connect at 1200 bps anymore.

2096. Re: Atari 835 a 1200 bps modem?

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-27 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>

Source record: 65625

Yes, you can! I call the Fordham Jesuit BBS, which carries the Fidonet National Atari Echo. I come in at 28.8Kbps (the BBS is rated at 33.6) but they still allow 300 baud connections. I also call The New Nest BBS, a PRO board that runs at 19.2 but still allows 300 baud connections. Same with the T.A.C.O. Bell BBS, which never exceeded 2400 and certainly still allows 300.

Face it. We can't afford to be snobs about this stuff. I believe I know why some sysops complain about slower callers, but there are enough who don't act on those feelings to make all callers welcome.

I use my Pentium for the Web (as often as I go to the Web, which isn't very
often.) Most of what I do concerns newsgroups and e-mail. You're right.
Anyone (I stay away from the "i" word) can use a PC to do the Web. What
I'm proposing is even more of a challenge than using 8-bits to surf. I
propose that somebody find a way to connect an 8-bit at more than 19.2Kbps.
Now, THAT's a challenge!

>
>cu
>Stefan Birmanns

Howdy Stefan

So If I had a 130XE with a 1 MB MIO and an internal 1 MB memory upgrade, the computer would only see the external 1 MB (in the MIO).
(I don't own a MIO, and from what I hear of it (some of them are very unreliable and any program you have in memory will disappear once you go into the Mio menu)
I don't want one. But 1 MB still sounds good. Damb, those PAL's are expensive.)

>used was 16 in graphics 11

Yes...but I don't know how exactly.
You know how to make display-lists?

Uhm.. I've seen a method with switching (fast) between
gr.9 (16lum) and gr.11 (16col) what gives a mixture
16colors with 16luminance(?) = 256colors. But that flickers...30/25Hz...

There is another method, but Im not sure how that works...
it looks the same but without flickering.

>used was 16 in graphics 11

No, not entirely in basic. You need at least a tiny machine language routine
that sets the color in a DLI (display list interrupt, i.e. it exchanges the
color registers "on the fly" while the display is generated). The trick is
to use the DLI for changing the background color of a graphics 9 display.

BTW, these aren't 256 colors. Brightness 7 and 8 coincide because of the way
how they are generated, and hues 1 and 15 coincide as well. You'll end up with
15x15 = 225 DIFFERENT colors, actually.

So long,
Thomas

Hello Chaps,

I haven't seen a FAQ posted to the group yet so excuse my ignorance. Is this the appriopriate newsgroup for the Atari 2600 video game system ? Most of the traffic seems to about the atari computer systems, have I subscribed to the wrong group ? Once again my apologies for such a trivial enquiry,

Thanks

Scott

2106. XEP80 and 850

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-28 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <34F87831.A49C9DDB@erols.comX>
Source record: 65385

Ok,
I got an 850 awhile back for kicks but never really tested it out. I've had a XEP80 since they came out ad bought Atariwriter 80 for it. I finally got some time and hooked up my 800XL with the XEP80, 850 and 1010 cassette. I booted into Atariwriter80 without any problems and wrote something really quick. The long and short of it is I cant get anything printed out to my printer via the 850.

What am I missing here?

Also,
Anyone know of any good uses for the XEP80 besides Atariwriter 80? Did any other software support it like Printmaster?

--
Thanks,
Steve

re: Proxy Server...

THAT'S an idea! Have some sort of intermediate conversion of
GIF/JPEG/PNG files into gr. 8 bitmaps! That way, Web access would
be approximately as fast as with a PC or a MAC. I'd also like
to know if it were possible to define a small 'web' that
consists of CGS code, so we could get web pages geared
specifically to our machines? Justa thought, but that's how we
could have color web pages and lightning speed. Imagine browsing
in gr. 15 or gr. 8, with images and sounds along with the text.
A8 interactivity at its best! Browsers to support normal pages
would also be ongoing at the same time, but we could have our
own subnet. Atari8Net!

: If this is true, then how is it that I've got a routine that traps the
: RESET key, preventing it from doing a normal reset. Wouldn't it have
: to return SOMETHING in order to trap it? Or is it possible to trap it
: via the NMI, before ANTIC gets a hold of it?

It has nothing to do with key codes.
Since you can't alter the interupt vectors without switching to a RAM OS
(and RESET will switch the ROM back in)
you have to tell the OS to run a sub-routine if it sees a interupt caused
by a particular reason.For instance you can tell it if a NMI was caused by
the RESET key (as oppossed to a DLI or VBI) to run a sub-routine.But the
RESET always happens first so your sub-routine will have to restore the
graphics mode and so on.There are only three interupts,compared with IBM's
256.
1.IRQ (interupt request)
This is pretty much everything but RESET,DLI and VBI.
The IRQ only gets through if the CPU doesn't have interupts turned off.
As far as I can tell all 256 IBM interupts are like this.
(the IBM term "IRQ" means something different)
2.NMI (non-maskable interupt)
These interupts are not blocked when you block IRQs or else you couldn't
use IRQs and NMIs together.It's caused by a DLI,VBI and RESET.
But you can tell the ANTIC chip not to generate NMIs for DLIs and VBIs.

: I guess I just assumed that some kind of key code was sent since it's
: a simple command (relatively) to keep it from doing a reset. If
: anyone's interested, I'll try to find the commands in my pile of
: history.

It's simpler to intercept a interupt than a key-code.

Alan Sharkis (asharkis@erols.com) wrote:
: Yes, you can! I call the Fordham Jesuit BBS, which carries the Fidonet
: National Atari Echo. I come in at 28.8Kbps (the BBS is rated at 33.6) but
: they still allow 300 baud connections. I also call The New Nest BBS, a PRO
: board that runs at 19.2 but still allows 300 baud connections. Same with
: the T.A.C.O. Bell BBS, which never exceeded 2400 and certainly still allows
: 300.

I've heard people talk about how older MODEMs have problems with newer
MODEMs but I think this has to do with compression standards.300 baud is
just too simple to mess up implementing.

: Face it. We can't afford to be snobs about this stuff. I believe I know
: why some sysops complain about slower callers, but there are enough who
: don't act on those feelings to make all callers welcome.

I never understood it.If you have a time-limit then your slow baud rate won't
make time go slower.

: > Preston Crow wrote:
: >>I thought I remembered hearing that CTIA provided 128 distinct colors,
: >>and GTIA provided 256 distinct colors (along with new graphics modes).
: >>Is it true that there was a difference in color generation between the
: >>two chips? (BTW, my 800 has CTIA, making me a certifiable old-timer.)

: >Uhm, I don't know about the color-count, but that could be correct.
: >AFAIK the "only" (hardware-) difference between 800 and 800XL
: >series-machines
: >is the CTIA/GTIA-chip (adds GTIA-modes 9-11 ?)
: >(and off course, the OS is different ;-])

: Actually, GTIA was introduced into the 400/800 line well before anyone
: had heard of a 1200XL or anything like that. Probably the majority of
: 800s came with GTIA, and many others were upgraded (I remember when
: our users group ordered a bunch of GTIA chips from Atari, but I didn't
: get one).

: The 800XL has a number of changes from the 800. Most notably:
: * 64K with bank select to switch between ROM and RAM.
: * Built-in BASIC
: * different OS ROMs.
: * PBI
: * Only 2 joystick ports

And the artefacting colours get swaped.That's why Ultima 4 asks you what
colour the top bar is.(press ^X while booting to see what I mean)
So if you think that Origin choose stupid colours just try playing it on
the opposite machine.
(you'll have to adjust the TINT to get blue & green for Ultima)

And my 800 has a GTIA as well so that has nothing to do with it.

Source record: 65396

Mark Newton-John (marknewtonjohn@webtv.net) wrote:
: I never said that WebTV is better than a PC. For some users it might,
: for others, might not. Same reason that an Apple might or might not be
: better than an IBM for some things...

: In any case, Microsoft may own WebTV, but they do not have their sticky
: little hands in it. It uses a proprietary browser, but it is mostly
: acronym compliant. (HTML 3.0, Real Audio, Shockwave, frames, Javascript,
: blah, blah, blah)

Well there's a problem right there!
There is NO HTML 3.0 standard.IT went from 2.0 straight to 3.2.

: Upgrades are automatic, sent over the phone lines when you turn it on.
: They absolutely will not crash. The display uses proprietary hardware
: and software to optimize the picture for a television, and it works
: better than most of the scan converters for PCs.

: 33.6 bps for the Classic, 56k for the WebTV Plus. Expansion port, Smart
: Card slot, S-Video, stereo audio, uses IBM keyboards, an infrared
: keyboard that really works...

It needs to have a RGB output.
Which reminds me of something that happened to me at Electronic Boutique.
I asked if they had any RGB cables for the Saturn and they just stared at
me like I was from another planet.But one worker spoke up and said that
"RGB was a type of monitor that isn't used anymore".
I only have old IBM computer so I'm out of date.Do IBMers not USE RGB
anymore???

: It uses a RISC processor. The Plus has a 4Gb hard disk, parallel printer
: port, picture-in-picture capability. On and on.

Why not just have a SCSI port so that you could plug in hard disk
drives,graphic systems and anything else you wanted/needed?

What kind of CPU does it use?

: There's the WebTV site for more information www.webtv.net.

Don't you still have to pay them money even if you use your own ISP?

I have a number of Atari items that I am considering putting up for sale as a "package" (no individual item sales, please). The main pieces include:

Atari 800 with power supply,
Atari 1200xl with power supply,
Atari 1050 disk drive with power supply,
MPP1150 parallel printer interface with cables,
Atari 1027 printer with power supply,
Star NX100 printer, and
Atarti 800 disk drive (not working - for parts only).

There are also some miscellaneous parts from an 810 upgrade, original joysticks, plus a small quantity of software titles (cartridges & disks).

Please give me an idea of the potential value of this "package" (i.e. what I should reasonably expect someone to be willing to pay for the lot). Thanks.

You will have to get a Ballblazer cart to get the pokey, which should not
be a problem :) Some carts have other fun stuff, like SRAM chips.

Some say the 600XL has a 2 chip x 4 bit setup. I know the two 800XL's
I've owned have 8 x 1 bit setups. In the case of the 800XL 256K x 1
bit wide by 8 chips for my upgraded Rambo one. It originally came
with 64K x 1 bit (8 chips) for 64K total. Also, the 800XL has a
monitor jack that is missing on the 600XL (not that that is a big
thing space wise). I actually owned a 600XL 1st. I never opened it
up though. I had a 600XL by itself in '83. Then I got a 410 program
recorder used. I was in heaven! I could actually SAVE typed in
programs! Well, I traded the 600XL for a 1020 plotter and bought an
800XL. That 800XL got fried by lightning so I had it replaced by
another. Still have that 2nd 800XL to this day. It has been Rambo'd
and has a chroma-luma mod I did to it. I do not remember which mod I
did but I _think_ it may have been published in Analog or Antic. It
worked nice with a Zenith Data Systems chroma luma capable monitor I
got. I could go on and on about the Happy 1050, the US doubled 1050,
the Black Box, etc but I think I am rambling. :)

By the way, ANYBODY need the docs for the Black Box? I can scan them.
I doubt Bob Puff would mind since you have to own a Black Box to make
use of the docs, or plan to develope software that uses it. Either
way I can't imagine Bob minding.

FTE never did very much except take a lot of money on pre-orders of promised hardware upgrades and new products, then the guy (Mike Holman) split with the money and has been on the lame these past 6 or 7 years now. Supposedly the FBI is finally involved and tracking him down, there are A LOT of pissed off people just waiting in line to press charges (and perhaps remove limbs) on this guy.

However there is hope, B&C Atari Sales & Service at 916-295-9270 is selling quite a bit of the old ICD/FTE product line and they just recently starting selling the new MY-DOS cartridges, I currently own one and its great! Just like SpartaDOS X, no need for a boot disk, just plug it in, turn on your drives and your all booted up, $19.95 is not too bad a price either.

>Superdos 5.1
> any clues??? thanks for your time.

The only two DOSes I know of that access the high-speed I/O of the Indus are DOS XL (includes a GTSYNC.COM file which must be loaded) and the SpartaDOS X cartridge.

The DIP switches on the rear should be labeled. If the label is missing, here's what they mean:
1-2 Drive select. up-up D1:, dn-up D2:, up-dn D3:, dn-dn D4:.
3 Density. up double, dn single. The only reason I see for this switch is power-up default, because the density is controlled by the DOS to read/write the disk.
4 Auxilliary. Not used that I know of.

If the front label is missing, here are the 4 buttons (left to right)
1 Write protect. Allows you to protect disks without covering the notch. Nice little safety feature to have.
2 Drive type. I never could figure this one out, and never really let it bother me.
3 Track. clears the error code on the track display.
4 Error. I guess it recalls the last error.

I have the manual around here somewhere (nothing more than a little pamphlet actually), but I can't locate it right now. Hopefully someone has it posted in a manual archive somewhere.

Hope this helps.

Spammers and other obnoxious morons cheerfully ignored.

I have build a few of the same upgrade 1 chip version of the SIO2.PC,
It's an AMAZZING device, easy to build and the APE software is GREAT!! I
have installed them INSIDE the 8bit and have a 9pin jack on the back of the
Atari XL. I used the GERMANIUM Diode - Radio Shack # 276-1123 You get 10
in a pack for $ 1.19 I have an XL over here with BUILD_IN SIO2PC, Pokey
Gumby stereo, 512k ram, Super Video and my own RAM-LED upgrade its a SUPER
XL!! I will build anyone the SIO2PC for a small fee of $ 20.00 Fully Tested
and I pay shipping in USA only. Im going to register the ape software, the
author has done a OUSTANDING program! and I need all the features of APE.

Best Wishes...

2129. Star Raiders Tribute Updated!

Newsgroup: comp.sys.atari.8bit

The Star Raiders Tribute web page has been updated!

The new stuff includes:

* A bunch of great .WAV audio samples from the game
* A bunch of cool .AVI video samples (with audio) of the game in progress!

http://zippy.sonoma.edu/kendrick/star-raiders/

And don't forget, it's the home of the 100% complete Star Raiders Manual! :)

Enjoy!

2132. PC-Interface

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-28 00:00:00 UTC
From: Roland Scholz <roland@uni-koblenz.de>
Message-ID: <34F7E4CC.3AB8@uni-koblenz.de>
Source record: 65573

Hello,

I have just finished a prototype PC-Interface (Bridge) for the Atari
800XL. It can talk to e.g. Hercules Card (probed) or virtually any
8bit-PC-card (drivers yet to be written). It is quite fast, I have
filled 4K of character-memory on a hercules in 2-3/50 seconds.

It implements a real PBI-Device, so there are no incompatibilities and
it doesn't use user RAM. The drivers resides in an extra ROM that is
mapped to $d800 (MathPack) when the bridge is selected .
I'd like to know who is interested in such kind of interface and would
pay about $40 for it.
In the case I get enough requests, I will make a professional
board and write some drivers for hercules, printer (centronics) and
serial IO over standard 8bit-pc-cards.

So long,

Roland

Only Atari knows that for sure. Yes the 800XL had 8 - 4464 or 4164 (64K) memory chips. Though this alone would not be the cause of the size difference of the PCB. Personally I like the smaller size of the 600XL.

2138. Atari 800 Collection For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1998-02-28 00:00:00 UTC
From: dpfonts <dpfonts@concentric.net>
Message-ID: <34F83E82.7827@concentric.net>
Source record: 65579

I have a very large collection of Atari 800 hardware and software for sale.

The collection is to large to inventory, but as far as software is concerned,
if it was made for the Atari 800 it is probably in this collection. Below is
a list of some of the main item of this collection.

1 - Atari 800 computer
2 - Happy Drive modified 810 Disk Drives
1 - 810 Regular Disk Drive
2 - 410 Tape Drives
50 - Tapes for Tape Drive
Over 1000 5 1/4" diskettes with probably over 2000 software titles, most of these titles include instructions (either original or photocopied)
Over 30 Books (either original or photocopied)
Assorted Cables, wires, power supplies and joy sticks
Other miscellaneous items

I am looking for best offer for the lot. I live on Long Island, New York and would prefer someone who could pick up the collection instead of shipping. This collection fills about 12 large boxes.

Please email responses to dpfonts@concentric.net, I do not read this newsgroup.

Dennis

2139. Re: 256 colors in basic

Newsgroup: comp.sys.atari.8bit

>>and GTIA provided 256 distinct colors (along with new graphics modes).
>>Is it true that there was a difference in color generation between the
>>two chips? (BTW, my 800 has CTIA, making me a certifiable old-timer.)

>Uhm, I don't know about the color-count, but that could be correct.
>AFAIK the "only" (hardware-) difference between 800 and 800XL
>series-machines
>is the CTIA/GTIA-chip (adds GTIA-modes 9-11 ?)
>(and off course, the OS is different ;-])

Actually, GTIA was introduced into the 400/800 line well before anyone
had heard of a 1200XL or anything like that. Probably the majority of
800s came with GTIA, and many others were upgraded (I remember when
our users group ordered a bunch of GTIA chips from Atari, but I didn't
get one).

The 800XL has a number of changes from the 800. Most notably:
* 64K with bank select to switch between ROM and RAM.
* Built-in BASIC
* different OS ROMs.
* PBI
* Only 2 joystick ports

Source record: 65582

We had a bunch of the power supplies just die. The 1050/400/800 supplies are identical as far as I know, I think they fail because they are slightly underrated for the 400/800 load- so they overhead insulation fails and they short, blowing their own inline fuse. It is likely any 9V secondary transformer will work, just find one with a 3 amp or so secondary rating from a mail order company; All Electronics, Alltronics, etc.. If you do homebrew your own supply, be SURE to put an inline fuse in the primary!!

Message-ID: <01bd4543$9a825500$LocalHost@pc001>
Source record: 65236

Atari 8-bit Enthusiasts,

I posted this message about a week ago, and it just caused an argument, and I got no offers of help at all, so I am posting this again. Please do not argue over whether I should do a video or a CD-ROM. That argument is over. I am doing a VIDEO only. As well as the general stuff I need listed below, I am also keen to get hold of a photo of Jay Miner, or any other people from the original Atari 8-bit development team.

So far I have a photo of Atari's HQ circa 1986, along with some key members of staff working at their desks within Atari. I also have an early photo of David Crane circa 1983. I also have photos taken inside Atari UK circa 1982. I am keen to get more photos, perhaps late 70's inside Atari HQ. Can you help? I will be getting video of Curt Vendel's prototypes (1450XLD, etc.) being used, etc. I may also be getting a couple of Atari TV commercials from 1982, but copyright is a problem here, so I can't promise these will be included. If you want to help, or you have any of the items I am need of, please E-Mail me at: video@dgs.clara.net Please do not just reply to the newsgroup, because I may miss your posting. Thanks.

Original posting from last week:

As you may know, I am currently working on a 'History of the Atari 8-bit' video, along with Andy Leininger who is looking after the U.S side of things. We are now working out exactly what will be in the video, and this is where we need your help. We are hoping the video will contain info you never knew about before, and/or won't have seen before. This is what we are particularly keen to get hold of:

* Photos and/or film/video of Atari shows (or of the Atari at non-specific shows)

* Photos and/or film/video of any Atari promotions (in-house stuff would really be nice)

* Press releases announcing Atari products (including the original one from late 1978 announcing the 400/800)

* Rare/unreleased press releases (esp. for the unreleased equipment or unreleased games)

* Any ex-Atari employees who could offer inside info/gossip from within Atari corp at the time of the Atari 8-bit's reign

* Any other material which people are unlikely to know about or are unlikely to have seen before

If you can offer any help with the above items, or have any comments/suggestions about the video and its contents, then please send E-Mail to me at this dedicated video E-Mail address: video@dgs.clara.net

To find out more about the video project, please visit: http://www.dgs.clara.net

Thanks,
Dean Garraghty

From: ansk@hotmail.com
Message-ID: <6dcduv$jn1$1@nnrp1.dejanews.com>
Source record: 65239

I remember a demo disk with 256 colour pictures for the Atari available circa 1985 (or earlier). One of the demo programs had pictures of a male face, a woman and the same woman* without clothes.

Does anybody know who the man was? According to the menu program, the picture was called 'ich', which I suppose is German for 'I'.

Btw, this 256 colour picture demo together with the famous robot/spaceship demo sort of wiped the floor with the competition from other home computers at a yearly computer hobbyist meeting that a local computer club arranged in the area I lived in back then. A small Atari stronghold on the countryside with circa 10-15 users was formed after that club meeting.

This does not happen to my system. I used the same copier and transfered .ATR's to my 1050 without any troubles. The troubles I have are things that can be avoided, in other words, Winpuke 95. That's doing stupid things if I run other programs, it sometimes crashes totally too. But, I think that's the buggy 95's fault. I am about to send money for registration and can't wait to see if the high speed mode works! Take Atarian care. BTW : Does anybody know what programs are best for making .ATR's (copying .BIN files into .ATR files) Thanks

I wrote a program that does just that. It creates disk images that
are compatible with either DOS2.5 or MyDOS (for large images). I only
provide the C source code, as I don't use DOS, so I can't compile for
that (though if someone will create the .exe file, I'll make it
available with the source).

You can find it at:
http://www.cs.dartmouth.edu/~crow/atari/

It's named 'unix2atr,' though I guess a DOS version should be called
'dos2atr.'

It some countries it is against the law to speak out against the government, in some countries it is against the law for a woman to show her face and hair and she must cover up in public, etc, etc.

Things we all take for granted here in North America.. are we that holy in saying our laws are superior to anyone else's? So, I agree with the other fellow.. Just because something is legal, doesn't make it right.. because something is illegal, does not make it wrong.. just look into American history about 50 years ago.. :)

Good job Bill! Envision was a classic piece of 8bit software.. you could
sure do quite a few interesting things for that piece of software.. and
cross platform developing isn't such a bad thing... the programming
environments on the PC are superior to that of the 8bit..

(well, an 8bit with a HD is actually pretty decent for developing..)

>You can use the XEP80 instead of the 850 as a printer interface.

You may have to. I seem to remember a Bill Wilkinson column in Compute! that mentioned something about Atari printer ID. He said all printers are designed to respont to P:, but individual printers are designed to respond to other codes, too. For example, a 1027 might respond to P2: but not to any others but P:. A 1025 might be usable with P3:, an 850 with P4:, a 1029 with P5:. (The numbers here are just for illustration. I didn't look up the correct ones.) The XEP-80 might have been built the same way, and AT-80 was written to use the XEP-80, so it might use the special XEP-80 code.

Since you asked, Pirated software is illegally distributed. Cracked
software is software that
has has its copy protection removed.

Cracked software become also pirated when it is illegally distributed

Talking about the 2600...
There's an adapter for the 5200 that will let you run 2600 carts; it's a true Atari item, although I'm not sure it's easy to find.
The 5200 is almost an Atari computer, so it shouldn't be very difficult to break inside this adapter and make it compatible with the XL/XE.
Sure, what the Atari 8-bit computers lack right now is more complex games, but it could be an interesting project, what do you think?

I'm familiar with NTSC and PAL. How different is Secam? From a
software standpoint, is it any different from NTSC, or are there
programs out there that will only run on one or the other?

I'm mostly just curious, but some of the emulator-writing people would
probably have a more serious interest if there are differences.

There is a device available from Bob Puff's company Computer Software
Services
called (I think) Ultra OS and that allowed you to set up your ram disk
as Drive one.
It actually made the program Typesetter very usable since you could swap
around the
three program sections quite quickly (but unfortuanly had to avoid the
130 version
unless you had a larger and divideble ramdisk. You need to install this
chip in your
system however...

Yeah, Put all those upgrades right into the XL, I cant get the Modem Options to work with APE116 at this point. I have APE in Com 1 and disable the mouse, still cant access the modem in com 2.
Maybe it the sharware version? I was thinking about putting the Rverter inside the XL also, Even with this small drawback APE is still the best software to use with the SIO2PC. Ive tried the SIO2PC Software and HDEMUL.ZIP but APE is FEATURED packed.

The 2600 adapter was nothing more than a 2600 in a smaller box. The 5200 was just a host that provided access to the TV, etc.

You gain nothing by hacking it. Its easier to just buy a real 2600. They are easier to find anyway.

2173. The 9th Adventurer`s Convention

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-01 00:00:00 UTC
From: Larry Horsfield <Alaric@larryhorsfield.demon.co.uk>
Message-ID: <5MyP6fAv7R+0Ewuu@larryhorsfield.demon.co.uk>
Source record: 65411

Hello there in C.S.A.8bit

There must be people in this NG who still play adventure games, be they text and/or graphic, either on their Atari`s or on PC`s under emulation. If so you may be interested to hear about the 1998 Adventurers Convention, which is being held in Birmingham this coming October, as it has been for the past 8 years.

The Convention is being held on Saturday, 24th October 1998, in the Ariel Suite of the Royal Angus Thistle Hotel, St. Chad`s, Birmingham B4, which at the end of the A38M and easy to get to from all parts of the country. It runs from 9am to around 6pm and covers all formats from Spectrums to PC`s, including Atari`s. Tables are available if you wish to bring along your own computer(s) and we actively encourage this as we depend on those attending to bring their computers, so the more the merrier! If you wish to bring hardware and/or software to sell you are more than welcome to, but no pirated software please!

The event attracts adventure enthusiasts from all over the UK, including Northern Ireland, and the atmosphere is very friendly and informal. Many of us stay overnight at the hotel and the evenings can be just as lively and interesting as the convention itself!

During the day we have the popular "Megapoints" competition running. In this the contestants get 20 minutes playing time at a specially written Spectrum text adventure, with the object of scoring as many points as possible in the alloted time. There are usually cash prizes and special certificates for the 3 highest scores. The adventure this year is being written by Ulsterman Jon Scott, author of various Spectrum text adventures published by Zenobi Software.

Tickets are available now and cost 6 ukp per person if you buy yours before 30th June, 1998. Thereafter, or if you pay on the door on the day, the price will be 7 ukp per person. Tickets may be purchased from:

Vicky Jackson, 128 Merton Hall Road, Wimbledon, London, SW19 3PZ

Please make cheques/PO`s payable to V. Jackson

* * * * * * * *

HOTEL ACCOMMODATION:

The Royal Angus Thistle Hotel has special room rates for those attending the Convention. These include full English breakfast and are as follows:

Single Room: 37.50 ukp per night.

Double/Twin: 32.50 per person, per night.

Please contact the hotel to book your accommodation, NOT the convention organisers. The address and phone number are:

Royal Angus Thistle Hotel, St.Chad`s, Queensway, Birmingham, B4 6HY

Telephone: 0121-236-4211

Don`t forget to inform the hotel you are attending the Adventurers Convention, otherwise you will be charged the normal room rates!

NOTE: The Convention is on the weekend before the start of the Birmingham Motor Show at the NEC. Whilst the hotel have promised to reserve a number of rooms for us, you are strongly advised to book your accommodation AS EARLY AS POSSIBLE to avoid disappointment.

If you have any queries about the Convention, or would like to reserve tables for your hard/software, please contact me at the email address below.

Hope to see you in Brum in October!

Ya, I just built my 1-chip cable for about $6 and it just blew me away. I think the only thing that would stop me from doing an internal upgrade to the computer is the thought of hacking up the machine's case to do it. I just bought a 1200XL on ebay (the 800XL keyboard is driving me nuts) that I need to do another cable for. Has anyone multi-tasked APE yet? If I'm on a Pentium II 233 with 128megs of ram, do you think I would be able to run one instance on com 1 and another on com2 to boot two machines at o
nce? I'll try it and let everyone know when I get the 1200XL.

BTW, APE is incredible - I just want to really thank everyone who went through all the trouble to dream the whole SIO2PC/APE system up. As soon as I get the spare $$$, I'm going to register. As far as I'm concerned, it's worth 5 times what it costs....

Aaron

I don't think there are much differences between SECAM and PAL (at least the frequencies are the same). The only difference is the chroma/luma keys are not transmitted the same: when watching PAL RF on a SECAM TV, the image is black and white.

If I recall correct, SECAM Ataris where distributed with a Peritel (SCART) cable which hooked on the monitor port of the Ataris and the SCART (Video) port of the SECAM TVs.

If that's exact, then PAL and SECAM Ataris could be the same hardware.

Now what I'd like to know is either the wiring of this cable (my TV can accept SECAM, PAL and NTSC on its SCART port) or if anyone can sell me a complete SECAM Atari (whith the cable).

Sorry, I don't have anything in exchange (I am not a collector, just a nostalgic geek looking for the computer hardware I began computing with).

2176. (Off topic) WebTV info

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-01 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6db83c$916$1@newsd-199.bryant.webtv.net>
Source record: 65414

Well, a couple of corrections. It was pretty late (or rather, pretty early) when I typed in some stuff about WebTV: The Plus has a 1Gb drive, not a 4 Gb.

I don't have all my information here, but the main processor is a RISC chip...

You can use your own ISP to access through WebTV, but the rate is $9.95 per month unlimited from the $19.99.

The reason they don't add SCSI, etc to this is it starts to become a PC. And this us NOT what the WebTV was made. Like, I don't need to save gigabytes of web page downloads, I surf. I lurk. I gave archiving stuff years ago with my ST.

Now for those crying, "Why is there discussion on WebTV, this is an Atari newsgroup?" Well, you're right. There is a WebTV newsgroup. But the relevance is that some soul out there is using Lynx and an 8 bit. For $99, they can have a 33.6 modem and fast graphics displays. In othr words, real net access, without the price. (Like Atari used to say) If you really want to ftp some programs from umich, then get back on the 8-bit...

I'll get the technical information for you tweeks out there and post it.

2177. Re: Netscape, Explorer setup vs. WebTV

Newsgroup: comp.sys.atari.8bit

Source record: 65415

What's complex you ask? How funny you should mention that you use Linux.

Now, ask any Joe on the street and ask him if he knows Linux. He'd just say, "Isn't that Lucy's brother, the one with the blanket?"

My point, and WebTV's is that you don't even HAVE to know ANYTHING about PPP or SLIP or POPs, or whatever alphabet soup you need to get onto the internet. And THAT is why a lot of regular joes DON'T use a PC.

WebTV uses a proprietary technology to display web pages using television monitors. And it is darn good. The resolution is there, unless some coder uses a yellow text on a pink backgound. (And there is a site out there that does!)

Okay, price. $2000 for a pretty decent PC including monitor. For what, web access? These people aren't going to run the company spreadsheet, compose a newsletter, or even deal with Adobe. They just want to access the internet and find out what bait they should use when they fish, to use a Yahoo TV ad.
Even a bare bones system is still at least $1500, when you could get a WebTV Plus for under $300, or a Classic for $99.

But this debate is not so much about WebTV vs a PC, but how to make the internet easy to access, and take it to the regular guy on the street, instead of some smart-ass kids that spout technobabble.

If anyone is in the Bay Area, and want to really see how this thing works, let me know. I work in a store that has these, along with 300 Mhz Pentium IIs connected to a ISDN line. I have shown computer users this, and they have been impressed to see what their sites look like with a WebTV.

I'll admit, there are a lot of idiots out there that make this thing look like an IBM PCjr. (remember THOSE?) But since I had one since about the beginning (Nov '96) I know the features.

2178. Graphic 8 images? No way!

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-01 00:00:00 UTC

Web graphics into Graphics 8 images? Are you kidding? Do you know how long it would take to even draw a small one?

Look, some JPEGs I've seen are the same size as the capacity of a 1050 drive. You mean you want to take a 120k image, even squeezing (rather grating it like cheeze) into a Graphic 8 image and watch each line get drawn will take all night. Okay, I'm exaggerating.

2179. Crash? What crash?

Newsgroup: comp.sys.atari.8bit

From: marknewtonjohn@webtv.net
Message-ID: <6db9ks$926$1@newsd-199.bryant.webtv.net>
Source record: 65417

Oh? Crashing in the middle of an email? Losing stuff? I think it has to be user error, or a computer down the line in transmitting the email.

I've been using this for over a year, I bought one within a month of it being released (Nov. '96) and have NOT had my machine crash.

Periodically there are small software updates, that are done at the main WebTV level. Then there are the big updates, when their servers download software to the terminals. Now in the last three big updates that I remember, and the countless smaller one, I have never heard of anyone yet "crashing" their system. Not from customers or other users.

I'd be interested in hearing how this unit crashed. I preview updates before they are released, so this is news to me. What happened, was it a classic crash and the unit hung up? Did garbage come up all over the screen? Did the unit have to be unplugged to reset it? (WebTVs do not have a physical on/off switch)

Demoville, the cobweb-filled tribute to the Atari's best demos has been updated a little.

My favorite less-than-8K pair of demos, "Intro1" and "Intro2" have been immortalized; animated GIFs and RealAudio clips for this duo. :)

And the audio awesomeness known as Gumi & Krawco's tribute to Tom Liebich, the "Liebich" demo, is also up at Demoville. Just one screenshot (no need for more), but 4 Real Audio clips! :)

http://zippy.sonoma.edu/kendrick/demoville/

I still need to add some Real Audio clips of Delerium Tremens and Joyride, and do some other demos... but hey, I'm only one person!!! >:^P

Enjoy!

Hi all atarians,

Just a note for those interested...

I've again done a big update to my Atari Games pages...
there are approx 610 games online now...
Also various games manuals/hints. (I'm looking to get a heap more
manuals/hints
online soon!)
So if your looking for something to run on those 8bit
emulators, come take a look around...

http://crash.ihug.co.nz/~aaronat/atari.html

There are no BANNERS, or PORN of any kind...just 8bit games.

I'm looking at doing a Atari 8bit High Score page for those interested.
Please send me your high scores for your favorite games..
(No cheaters please!)

Send email to aaronat@ihug.co.nz

Depending on the response, the high score page will be online by the end of
week.

regards

Holmes.

Speed isn't the issue here. On an ML level the Atari is capable of
moving
nearly 64K per second. If the image was d/l into a ramdisk (like a 1 meg
MIO)
the image could be displayed in a few seconds. The real problem is
trying to
compress the image to fit the screen and still be viewable. In graphics
8 about
85% of the image would have to be dumped.
The real problem would be readability in handling it in this manner.

Pat.

Back in the time when 1200 baud modems had first arrived on the scene

Jim Harris had found a location in Telelink that set the baud rate and
was ready
to create a 300/1200 cart. He mentioned this to me before he did it, and
I asked
him about his method. After understanding how the hardware was going to
be
created I suggested that he set up the cart to handle 2400 baud as well.
He thought
I was a bit wacky to suggest such a thing, but it was an easy
modification. Less
than a year later he was using it. (But not thru an 835, it WAS only 300
baud capable.)

2188. Re : SECAM Ataris?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-01 00:00:00 UTC
From: jmouchmino@aol.com
Message-ID: <19980301162101.LAA26055@ladder03.news.aol.com>
Source record: 65426

It seems the SECAM computers can only display 128 colors because of different chroma/luminance settings.
The colors are not the same and you have a loss in picture quality.
On some SECAM 130XEs, you have some red ''bars'' on the screen and the picture can be somewhat blurred...
I was told, though, that the image could be made much clearer than it usually is.
The SECAM 800XLs seem to be a lot better.
I actually got my SECAM 800XL in 1984 and bought a PAL version about six years ago and I never really noticed the ''fuzziness'', but believe me, I can really feel the difference now!
Unless you want them for your collection, my advice is to never buy SECAM Ataris!
By the way, I know that the Voice Master (COVOX) were imported to France in two different versions; I remember trying to load a demo of this program on my SECAM XL and it just wouldn't work, while it would run perfectly on my PAL system!
To run the new and not so new Polish demos and some European games, you will REALLY need a PAL system (both NTSC systems and the current emulators have problems dealing with them).
A PAL system will run ALL American games, albeit slightly slower.
Greetings from France,
Bertrand.

Aaron Christopher Finney <aaron@orr.wfi-inc.com> wrote in article
<6dbaddgi1@news01.deltanet.com>...
<SNIP!>

You know, I'm not going to knock APE. Stephen Tucker did a fine job with it. But even he can't straighten out a problem that I've been having with it.

Suppose I save my club's newsletter disk as a couple of .ATRs on my PC, and then I want to copy them back to a real Atari drive (XF-551 or 1050) thirty-five or more times. I try using MyCopyR, the J option in DOS 2.5 -- anything. The .ATR transfers to the Atari correctly, but when it's time to save to the floppy, the serial bus seems to overrun the drive and the process halts. I don't have that problem when I run SIO2PC software.

I've tried slowing APE down by using stupid mode, going to single speed, playing with other settings. Nothing helps.

My clone is a Pentium 100 and the SIO2PC is on COM 2 with my modem on COM 1. The mouse operates off a card at an entirely different IRQ.

The Atari system consists of a 320K enhanced 130XE with the Puff US-OS+ upgrade, a switched Quintopus, two 1050s and an XF-551, a P: R: (which is switched off when the SIO2PC is operating), an early SIO2PC 2-chip interface with no diode (built by Nick Kennedy), an XEtech Graphic AT printer interface, and a Wizztronics MidiMax interface.

Has anyone else run into something like this?

1050 drive? Are ya kidding? I stopped using mine 5 years or
more ago. my smallest capacity 5.25" is an XF551, which I only
have for backward compatibility. I also have an XF551 with the
CSS 3.5" upgrade. 720K. When my Hard drive is re-set up, it will
be a 320M Maxtor. I don't mess around with 90K formats anymore
unless its a purchased disk, or a DCM. I really wish everyone
still using an Atari 8-bit would get a DSDD drive, at least,
as we have to advance the state of the art beyond SSSD. Whole
new worlds of usefulness open up when you have at least 360K,
instead of 90k. Think of how much informaation could be on a
Disk-of-the-month! AND it could load at UltraSpeed!

An idea would be to download the HTML script and image(s) to a RAMDISK or a hard drive. Then the computer would interpret the page without the overhead of simultaneously downloading. Then it could save the resulting page bitmap (with clickable spots saved as well) to the HD, and you could back up to that page without having to re-download and reinterpret it. Should only take a couple of meg max for a temporary file for that session. You could even save your hotlist in this way, saving a lot of time. Loading a page bitmap from the HD would be a matter of maybe 3 seconds or less! It would poll the HTML from the site, and only if something had changed would it have to re-do the page on your end. In that way, it would be self-correcting.

Yep, there was one. But it's a 2600 console that uses the 5200 for power, audio/video, and controls(I think). I have one for my Colecovision so it's about the same thing.

> The 5200 is almost an Atari computer, so it shouldn't be very difficult to
> break inside this adapter and make it compatible with the XL/XE.

You forget one thing...the 5200 had so many "mutations" it is incompatible with the 8-bit as it stands. You need the special pins on the 5200 cart port that pump the adapter's audio/video into the 5200. Plus the 5200 has different hardware locations for the same stuff that the 8-bit does.

> Sure, what the Atari 8-bit computers lack right now is more complex games, but
> it could be an interesting project, what do you think?

Another theory would be software emulation, well more like hyopthesis. I know someone (Nick B) who took the source code of Combat and modified it to run on the 8-bit. Both 2600 and 8-bit platforms share virtually the same type of CPU, and you just write the graphics to a space of memory instead directly on the screen. Plus you have to adjust for sound and player input like joysticks and switches.

Perhaps that same concept could be applied making a program that loads 2600 image files, same ones used on PC emulators, and run them on the 2600 adjusting register locations and such. But like I said, it's more of a hypothesis then an actual theory at this point.

I wouldn't expect that to work..

>Doesnt work with composite monitor cable

There are both color and monochrome monitor cables, depending on which
lines are connected. Any idea which you have? If you have a cable that
separates the chroma and luma signals, you'd want to attach the luma
output to your mono monitor. If you just have one video out on your cable
it's probably a regular compositie video signal, but I think that should
work!

>Also,
>Was anything else made that works with the XEP80 besides AtariWriter 80?

A few things. Other editors include:
TurboWord by MicroMiser
emacs subset by mailto:slackey@slackey-sun.cisco.com (Stan Lackey)
MAE and its previous standalone editor ED

BobTerm, Kermit-65 and VT850 all support the XEP80.

BASIC XE and SpartaDOS X work with the XEP80.

And of course anything that sticks to normal E: gr.0 access will work.

That may be about it!

The vector is called DOSINI in positions 12 and 13, all you have to do is to
write your routine, in assembler and put its adress in dosini, just remember
the last instruction in your routine must be a JMP to the original DOSINI...
Correct me if i miss something....
Hope it helps.

2200. Aquatron? Defnder-style game

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-02 00:00:00 UTC
From: john.moffat@lion-nathan.co.nz
Message-ID: <6dfq49sbo1@nnrp1.dejanews.com>
Source record: 65188

Hi there,

Does anyone remember a game for the 8-bit computers called Aquatron.??

I can't seem to find any reference to it anywhere. I used to have it with my old 8-bit, but then sold it all off, and the new 800XL & software I bought doesn't have it.

It was a defender style game with water at the bottom and sky at the top. Approx 1 and 1/2 screens high. You could go to the top of the screen and fly faster to traverse the area. As well, if you came out of the 'faster' area, and tried to go into the water, you would explode.

Anyone remember this?
Perhaps it went under another title??

Many thanks,

John E. Cash

From: dhayner@seacoast.com
Message-ID: <6dfrjktsm1@nnrp1.dejanews.com>
Source record: 65189

FOR SALE: Complete Atari 800 system in excellent condition. Make me an offer on the whole package. I'll sell to the best acceptable one received by March 31. If none are acceptable, I'll entertain offers on individual items. Buyer pays the shipping from Boston.
Hardware:
* 800 computer with OS, 48K RAM, Owner's Guide, extra 16K RAM
* 810 disk drive with Owner's Guide, Introduction to DOS II
* 850 serial interface with Operator's Manual
* 830 acoustic modem and AMODEM
* 1027 character printer
* C. Itoh Prowriter dot matrix printer
* Commodore 1802 monitor with User's Guide
* Paddles, joysticks, trackball
* All power supplies and cables
Software:
* Assembler Editor cartridge and manual
* Atariwriter cartridge and manual
* BASIC cartridge and BASIC Reference Manual
* SynCalc and manual
* SynFile+ and manual
* Centipede cartridge
* Age of Adventure
* Alternate Reality
* Archon, Archon II
* Ballyhoo
* The Best of Antic
* Caverns of Mars
* Conan
* Cosmic Balance II
* Cutthroats
* Data Base/Report System (APX)
* Enchanter
* The Family Tree (Antic)
* Forth (Antic)
* Galahad and the Holy Grail
* Gemstone Warrior
* Ghostbusters
* Hitchhiker's Guide to the Galaxy
* Megafont
* Micropainter
* Moonmist
* Original Adventure
* Planetfall
* Print Shop

* Program-Text Editor (APX)
* Questron
* Sargon III
* Sea Dragon
* The Seven Cities of Gold
* Sorcerer of Claymorgue Castle
* Sorcerers
* Spellbreaker
* Starcross
* Stone of Sisyphus
* Suspect
* Suspended
* Ultima I, II, III, IV
* Witness
* Zork I, II, III

Documentation:

* Mapping the Atari
* Compute's Second Book of the Atari
* Starting Forth
* Assembly Language Programming for the Atari
* De Re Atari
* Hardware Manual
* The Creative Atari
* The Musical Atari
* 45 Antic magazines from Feb/Mar 83 to Dec 87
* 48 Compute magazines from Mar 83 to Jun 87
* 39 Analog magazines from May 85 to Dec 89

When I was working at Electronics Boutique and the Genesis
was new, I plugged an unmodified Sega Genesis controller
into my 130XE and it operated fine. All directions were correct
and the "B" button was the fire button. It sounds like the stick you
used has autofire or other options in it. If you buy a stick without
any of the fancy "extras" then any modifications won't be necessary.

Pat.

> !! Request my *FOR SALE* LISTING OF CLASSIC VIDEO GAME STUFF !! 2000+ Lines !!

Nope. The DRAM is refreshed by ANTIC. REF is brought up and the RAS
address for the next row of memory is put on the address lines by ANTIC.
This stops the CPU and refreshes memory every 2ms or so. The old ANTIC
only refreshed 128 row addresses, so it could not be used by a 256K
DRAM, which requires 256 rows. The larger chips require even more row
addresses - quite a problem if it weren't for their hidden refresh
capability. With the new chip/SIMMs, you just tell him to refresh and he
does his own addressing stuff. Doesn't matter which ANTIC you use.
You are close on your OS activity refreshing memory. If you cripple
refresh, it is very difficult to see it fail. I used "PASSIONATELY", a
demo, to test my refresh. As you watch it run, the data gets more and
more corrupted.... Drove me nuts for a while!

Bob

I saw 16meg simms that could be used in the 8-bit for $50.... I'm not
too excited about spending $50 for something I really have no use for,
but if someone out there in 8-bit land is willing to finance the
project, I'll build them a 16 meg Atari.

I use my 130XE and Bobterm to call Delphi and check out this newsgroup on a nightly basis.

I use Textpro 4.54 for all my word processing and find it more than adequate for anything I try to do with it, including preparing an annual report of the crops I plant for the USDA. They tell me at the local office I give the best crop report they get.

I did my taxes last month, and used Syncalc to break down my property tax and tractor fuel bills and calculate the deductible and refundable parts.

Anybody remeber Customer List Manager from the August '89 Antic? That was mine, and I still use a revised version every year in my vegetable stand business. A modified version keeps track of our Christmas card list.

Oh, and every once in a while I'll even play a game or two!

Hmmm....

Violating the Law is an intrinsically Wrong thing to do. But there are other, more intrinsically wrong things, if only a few of them. I the case mentioned, it was illegal to help slaves escape to Canada at one time. Some people thought it was worse to obey this law than to let people be owned. It was at one point, illegal for a white man and a black man to sit at the same lunch counter is some states. Again, some people thought that a greater wrong than breaking that law would be. There are many other examples, just as there are far more where it is clear that it is a lesser Wrong to obey a stupid, or even Wrong, law, than to disobey it.

Don't have the code here--saw it, in among other places, Compute! magazine. (I think). If you have access to a good 8-bit tech book, such as De Rey Atari or Mapping the Atari, it shouldn't be a big deal.

You set up a screen in one of the 16 color modes, say GR. 11, or better yet, GR.9. You make the image on the screen a series of lines of different shades, say 0-15, repeated 16 times or more. you then set up a display list that calls a ml routine every 16th line. This routine bumps up the number in the register that holds the color of the screen, MOD 16. Then you point the appropriate register to the custom DL, and put in a routine that fakes a keyboard input (a simple poke every 8 minutes will do, or maybe at the end of each screen display, during the VBI), and there you have it.

I posted these for trade once before, I screwed up my mail boxes, so I lost most of the replies. So here they are again. I'll make it easy this time - I'm ONLY looking for Atari 2600 game(s) I don't have. I don't have a specific want list, but ONLY rare or better games. I will possibly trade all of these for 1 game, depending on what it is.

In-Store Demo Cart CXL4019
Squish 'Em
Caverns of Mars RX8021
Kids on Keys
Coconotes
Defender
Space Invaders
Missile Command
Asteroids
Centipede
Pac-Man
Star Raiders

Thanks, Alex

With PC's that ship with MSIE 4 you CAN NOT uninstall it. My friend Anthony
got fed up with it and deleted it, and W95 became inoperative. It replaces
Windows explorer with it's own code, and nothing short of reinstalling a
pre-IE4 copy of W95 will get rid of it.

The /EXTSEL Signal disables the internal XL-Memory. I think, most of the internal memory expansions will disable, too.
But what do want to do with 1MB in an XL? I know only a few programs, using the XE-64KB-expansion...

2216. P: device numbers

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-02 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6dds3satg1@newsd-199.bryant.webtv.net>
Source record: 65259

Yes, it is possible to define a printer like a disk drive, e.g. P1:, P2:, etc, BUT, I think it was not implemented in either the OS or the device.

I may be wrong, but as I remember, the problem arises if multiple printers are on. All of them will respond, or the first in the daisy chain if a print command is issued. At one time I tried this and calling my 1027 P2: didn't make a difference. It's probably because printers don't have the device number select like the disk drives.

I should reassemble the rest of my 8-bit system and try this. I had a 1027, 1020, and a 1025 connected at the same time, but did not have all of them on when I needed to print something.

I used to point the reset vector back to the basic carts error handler. That way, you can set some error handling code in basic that got triggered by a reset. Made basic progs like m/code ones - hit reset and they restart from the title screen, or whatever.

Dwmoar,
You are correct. However, by using some logic and combining all 8
joystock pins as 1 data byte, you can actually control up to 256
devices. Using the optoisolation is an excelent idea. BTW, you can
actually do a combination of data acquisition and process control with
this system if you really wanted to take the time for all the design
work. By adding the trigger pins of both ports you then have 10 bits of
data to work with. This makes for some rather nice control of the
interface circuit(s), a bit of feed back, if you will.
There is a very nice book called "Your Atari Comes Alive" by Richard
Leinecker and david Burd. The book was published by Alpha Systems, and
is completely designed around the Atari 8-bit computer. I like it better
than the Radio Shack books. The RS books are good AFTER you have gone
through this book and done these projects.
Anyway, Using the joystick ports as control I/O is great and it's
pretty easy to do.

From: AsciiRider <atebit@wwa.com>
Message-ID: <34FAD4EE.26A6B0E3@wwa.com>
Source record: 65266

Well, I've done it. I have actually used my 800xl for something productive. I always tell my girlfriend "Look! you can do this , you can do that, blah blah blah" - but I never actually did anything. We all know the story behind that - most of us have pentiums nearby.

Anyway, I just started collecting 2600 carts. I thought to myself that it would be great to maintain a list of atari carts on an atari. I only have 37 carts, but I wanted to have a list with me when I go junking so that I don't buy ones that I already have. Also, some games were released by different companies so I did need to know who made the carts I have. More importantly, I wanted to alpha sort my list for easy checking in the thrift stores.

So what database should I use? I had a few - Synfile+,Data X, Dataperfect. I played around with all of them before. Synfile+ looked to be the most friendly. Dataperfect looked to be the most powerful. I decided to go with Synfile+.

So I fired it up, created a five index form, and started entering my data. I'd say it took about five minutes to get started. What fun! It took me a little time to figure out the report writing part, but I finally got my list alpha sorted and printed out.

Finally! I did something with this machine from my childhood other than play games. I think it is a perfect match for a small database. It takes less time to boot than a pc, it takes less time to get started entering data also.

So, What do YOU do with your Atari?

Oh yeah, I have a couple Synfile questions. I got it in trade(Bob Klass), so I don't have the manual.

How do you get it to use two drives?
Anyway to to save the reports you design?

Dear Atari owners,

I am wondering if anyone can help me.

I own an Atari Mega 1 that I use for music. It originally came with Microsoft Word for ST and I currently need to do some word processing on it.

Unfortunately, though I still have the mauals and documentation, the Word disk was stolen and I need to get a replacement. Does anyone have a copy of Word for ST they can send me or email me?

Please email me directly since I do not receive all postings to the group.

Thank you for your assistance,

Robert Davis

p.s. Please don't flame me about software piracy. I have purchased all the software I use, I do own a licence for this package and this package is not currently sold commercially.

Robert Davis

Message-ID: <34FB0C0D.2367F76E@erols.comX>
Source record: 65274

Ok,

I've got this Maganox Video Monitor 80 that has one of those monochrome
Green Screens. It has 1 port on the back for video input but no audio
jack :(.

Anyhow,
I've used this in the past with my XEP80 and it works great with that.
I've recently set it back up and wanted to use it without the XEP80 and
connect it directly to my 800XL. No matter what I do, I can't seem to
get the screen to come up. I've used the RF connector in the back to no
avail and also tried my montior plug Im using on my 130XE.
Im at a loss as to how I would connect my 800XL to this thing!

Recap:
Works with XEP80
Doesnt work with standard video out plug (RF)
Doesnt work with composite monitor cable

Any clues?

Also,
Was anything else made that works with the XEP80 besides AtariWriter 80?

2232. Re: Atari Joystick recommendations?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-02 00:00:00 UTC
From: dlormand@aztec.asu.edu
Message-ID: <6df3ib$2uv@news.asu.edu>
Source record: 65275

I did this up before I read a message here that seems to indicate that unmodified Sega controllers will work on an Atari 8-bit. If so, I would like to hear about it!

For other machines (like my TI-99/4A primary rig), an almost-compat like the Sega controller will not work, so the following mod is necessary.

==========

How To Convert a Sega Genesis Controller to Atari Standard Pinout

The Sega controller almost has the same pinout as an Atari Standard joystick (wonder why!). The lowest-cost model (no-frills, three fire buttons, ~ $10 at Toys R Us) can easily be modified for use with Atari STs, Atari 8-bitters, TI-99/4As (mod tested on these) and probably all other home computers from the 70's and 80's. With this mod, the movement pad will work like a regular joystick, and the middle fire button ("B") will work as a joystick fire button.

1. Unscrew the 6 screws and lift off the back. Remove the cable/board assembly.

2. Disable the single logic device (74HC157) by:
a. Cutting pins 4, 7, and 9, or
b. Cutting the entire chip clean off!

Note that, holding the board so the "notch" at the end of the chip is "up", pin 1 is at the upper left corner. Pins number down the side and up on the other side, with pin 16 opposite pin 1. Remember that when looking at the reverse (circuit) side, the image is flipped!

3. Make a solder bridge between pins 3 and 4, 6 and 7, and 9 and 10. If globbing on enough solder to make the bridge doesn't appeal to you, use a bit of wire, like a bit of resistor lead from your junkbox.

Options:
1. The one-side circuit board is pretty easy to trace out. You could easily jump the other fire buttons to "B" so they all work.

2. Supposedly, with a bit of ingenuity, you could put a very small three-pole, double-throw switch somewheres on the controller, NOT cut the chip off the board (but merely clip pins 4, 7, and 9), and wire the switch in such that

pin 3/6/10 ------o\
\o------ where pin 4/7/9 used to connect
on the circuit board

pin 4/7/9 ------o
(stubs on the chip)

And you can switch the controller between Sega and Atari modes!
(This has not been tried, it just stands to reason!)

Both demos were coded by the group TAQUART, i remember intro2 says so..
Hope it helps.

2235. Re: P: device numbers

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-02 00:00:00 UTC
From: jhardie@pipeline.com
Message-ID: <34fc2671.2098868@news.pipeline.com>
Source record: 65278

Actually each printer had it's own embedded code. The 1020 was P8: I
think. The reason for this is so you could have multiple Atari
printers on-line at the same time and by specifying P1: thru P8:
instead of just P: there would be no confusion between the printers.

I use my Atari's for nostalgia and entertainment, though that's not to say
that they don't do usefull things in the meantime. I have been known to
turn in papers for school written in AtariWriter and printed on a BMC
BX-80 dot matrix printer, I keep my names/addresses in HomeCard, and
I have been trying to get Pascal to work enough to do my comp sci homework
on it one time. And then there are the tons of games, which are always
huge social events at my pad, with lots of punching and beer-guzzling and
bragging about how good we used to be on the old coin-op Popeye machine at
the local mexican market....

AsciiRider (atebit@wwa.com) wrote:
: Well, I've done it. I have actually used my 800xl for something
: productive. I always tell my girlfriend "Look! you can do this , you
: can do that, blah blah blah" - but I never actually did anything. We
: all know the story behind that - most of us have pentiums nearby.

: Anyway, I just started collecting 2600 carts. I thought to myself
: that it would be great to maintain a list of atari carts on an atari. I
: only have 37 carts, but I wanted to have a list with me when I go
: junking so that I don't buy ones that I already have. Also, some games
: were released by different companies so I did need to know who made the
: carts I have. More importantly, I wanted to alpha sort my list for easy
: checking in the thrift stores.

: So what database should I use? I had a few - Synfile+,Data X,
: Dataperfect. I played around with all of them before. Synfile+ looked
: to be the most friendly. Dataperfect looked to be the most powerful. I
: decided to go with Synfile+.

: So I fired it up, created a five index form, and started entering my
: data. I'd say it took about five minutes to get started. What fun! It
: took me a little time to figure out the report writing part, but I
: finally got my list alpha sorted and printed out.

: Finally! I did something with this machine from my childhood other than
: play games. I think it is a perfect match for a small database. It
: takes less time to boot than a pc, it takes less time to get started
: entering data also.

: So, What do YOU do with your Atari?

: Oh yeah, I have a couple Synfile questions. I got it in trade(Bob
: Klass), so I don't have the manual.

: How do you get it to use two drives?
: Anyway to to save the reports you design?

by default, the xep80 handler will capture the printer port from the
850. there are some options while booting to disable this, they are
listed in the xep80 docs so you should have no trouble figuring it
out. i would look it up but my manual is away in storage, sorry.

Source record: 65201

My father uses 2 800s hooked together with a 810 to integrate a low frequency radio receiver and seismograph. One 800 controls the experiment circuitry and writes the raw data to the 810, the 2nd reads the data and does fourier transforms and loads of other processing ultimately loging seismic "events" and radio data. The 2 machines are synced at bootup so they don't attempt to simultaneously use the floppy. Its kind of interesting that both 800s can share the same floppy drive, but it works.

The experiement is intended to detect low frequency radio waves emitted during an earthquake. To my knowledge, he hasn't measured anything conclusive, but the system is neat to watch. As to why doesn't he grab a digital IO board and use Qbasic/C/Visual whatever on a PC? We have a pile of Atari equipment in the basement, he was aware of the capabilities of the joystick ports, so he went ahead and used them- plus he likes the Atari Basic string and array handling.

To reply, replace nospam with menkesjg. Thanks.

Gregm

We have been getting some really great replies to my post. It really is wonderful to see how people use
Ataris. Not that I mind the usual Piracy, For Sale, Auction, WAY over my head hardware stuff, TCP/IP, Atari
vs. CBM, etc..... :)

This is totally unrealted to my original post, but...

I recently became the Suburban Chicago Atarians 8-bit public domain librarian. I was really surprised to see
how much great stuff was in the public domain written by people that obviously loved their computers. I always
thought that public domain software was lesser quality (and in many cases it is).

Anyway, I intend to do a quick and dirty web page of the library. I finally found the text index disk, and I
will upload the stuff Wed. I think it is an impressive collection, over 250 disks packed

with stuff. There
are TONS of Print Shop graphics. You will be able to order the disks from the club, I think they are $2 a
piece. They all have printed labels.

Perhaps you will be able to find a program you haven't seen for a while. I eventually plan to put this stuff
into a database.

Keep on Atari'n

Message-ID: <01bd466d$8839a260$ddedb7cf@rjiredff>
Source record: 65211

I picked up a copy of this Parker Bros. cart new in box with instructions. Unfortunately, it didn't seem to work on my Atari 800XL. I know that some older carts were not compatable with the XL/XE line, and since the instruction book said it was made for the 400/800, I'm guessing that is the problem.

I'd like to trade it for the 5200 version of Astrochase. Anyone interested?

Thanks,

Mark

Howdy Guy

I tried to send back a message telling me I could buy the Pamela & Tommy video for 10 bucks. Today I received a message from their mailer deamon. The address was closed because of spamming.

CU Mathy Van Nisselroy

PS Haven't found the version of Inertia Mod Player you send me via Email. But Bernard Kok somehow found it. I downloaded it of his BBS (BecoTel)
It's really GREAT. (haven't tried it with the (Gumby/double POKEY) Stereo XE yet, but....)

>
>cu
>Stefan

It's the "being able to" and "If I need it I have it" thing.
And "external" means: Unplug from one computer and plug it
into an other (nice if one computer gets sick). And....there's more
room outside my computer than inside.

>Curt

Are you sure this is NEW. I've got a letter, written by mr. Charles Marslett himself (oh, holly one.
I be thei survant.) saying he put version 3.1x on cart. I guess 3.14 and 3.16. Have to check that out.
If it's REALLY new, I want one too (as in YESTERDAY).

Please check if this is really new and has all the features 4.53 has???

>Thanks in advance,
>
>Joerg

I guess the only places you will get those is in the USA (B&C ComputerVision, Best
Electronics, American Technavion).
Maybe, just maybe, the ABBUC (a German Atari 8 bit user group with just under 500 members,
most of the ofcourse in Germany
But some live in other countries.) might know where to find them. If you find a place in
Germany let me know. I'm studiing
in Aachen, but live in the Netherlands.

CU Mathy Van Nisselroy

BTW the numbers are only good if your dealling with people who speak ATARI. In normal
electronics stores you get stupid looks.
The number starts with Co 14 I believe. hmmm, aren't these numbers in a FAQ somewhere.

March Auction - Update 2

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, March 16 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

A1. Atari Personal Computer System Operating System User's Manual. CO16555 November 1980. 215 pages. 11 Chapters: Introduction, Operating System Functional Organization, Configurations, System Memory Utilization, I/O Subsystem, Interrupt Processing, System Initialization, Floating Point

Oh Nick! <roflol> Too bad its not closer to April the 1st! (Fools day!)

Seriously, if you can't find someone to help with this, why not grab one
of the following:

Edith
Everest
QED
7UP
ST Writer (elite)

AFAIK, these are all shareware/PD programs and in the case of the first
3, very world class... ;-)

That just isn't true. If you've installed the "active desktop" component (which replaces the regular Explorer with Internet Explorer), you can get rid of it through "Add/Remove Applications" in Control Panel. It really isn't that tough.

So, YOU're the guy that I heard about at SCAT!

Well, I'm the newsletter editor for OHAUG and I use my Atari and my Pentium, hooked up together, to produce that newsletter. Well, actually, most of the work (my writing and that of others) is done on the Atari. I use Xlent Word Processor because the former editor set the newsletter system up that way, but it wouldn't really matter if I switch to TextPRO or something like that. If any text comes in via the Pentium, it gets null-modemed to the Atari and I edit and format it for the newsletter disk there. I also get disks from other user groups and they, of course, get checked out on the Atari so that they can be demo'd, given to our librarian, used in our newsletter, etc.

The Pentium lets me get files from the Pool Disk and I can duplicate the newsletter faster from .ATRs on the Pentium than from copying disks with the Atari alone.

The entire process is done with no hard drive for the Atari system. I can do the job with only one floppy drive, but I usually use three for convenience.

As you say below, user group libraries are great places to get stuff. Of course, we have lots of guys with Web pages and ftp sites up now, and UMICH and the Pool Disk are great sources. But not everybody in the community can access the Web, or UMICH, or even the Pool Disk. That's why I hope that our user groups continue.

<SNIP!>

Yep, Aquatron was originally released by Sierra On-Line and then re-distributed
by Main Street Publishing in cheap packaging.
I did have it and remember it was very fast.
Grtx,
Bertrand.

I think more to the point that if the stick comes without autofire or
other extras
(plain vanilla) it should work. Unless EVERYTHING out there that is
being
produced has something like autofire/rapidfire I would think that some
third
party manufacturer must be producing an electrically equlivent copy.

Actually this is one of those "What did I do with my Atari"

In 1985-86 I was producing newsletters (for both LIAUG and my wife's dental
assistants society), writing articles, and because of the advanced graphics
capabilities made a series of installation documents that netted me a promotion.
The company that I worked for was so impressed with the appearance that they
marketed them nationally.

Pat.

Message-ID: <19980303152601.KAA06733@ladder02.news.aol.com>
Source record: 65228

I'll check my docs, but I'm pretty sure that Atariwriter80 is one of the few programs that assign numbers to the printers. Whatever is connected to the XEP80 would be P: or P1:, and something else is P2:, then there's a P3: and maybe even a P4:. I know this sounds crazy to a lot of folks out there, but somewhere in the XEP80 manual or Atariwriter80 manual, you'll see this kind of thing.
Now when I go home this evening, I'll have to check.....

Bostone1@aol.com

(Asks about 'what do you do with A8?'.)
I'm sorta like the newly wed, I just can't leave it alone.
I was gonna write a longish thing about my recent (present)
experience finally getting a hard drive working on my
A8. It was tough and I couldn't have done it without
help from Jim King, Martin Quinones, Jason Duerstock
and Tom Hunt.
Russ

I bought a generic pad that didn't have anything. It still didn't work. I
tried a couple from Sega and they did work.

2272. Re: DRAM refresh

Newsgroup: comp.sys.atari.8bit

> Nope. The DRAM is refreshed by ANTIC.

Is there anything these chips wont do? :) Amazing.

> REF is brought up and the RAS
> address for the next row of memory is put on the address lines by ANTIC.

I see on my schematic that REF goes only to the MMU, does this tell the MMU
to unselect all the devices its generating CS for? Is there a list of the
signals on the MMU and what they do anywhere?

> This stops the CPU and refreshes memory every 2ms or so. The old ANTIC
> only refreshed 128 row addresses, so it could not be used by a 256K
> DRAM, which requires 256 rows. The larger chips require even more row
> addresses - quite a problem if it weren't for their hidden refresh
> capability. With the new chip/SIMMs, you just tell him to refresh and he
> does his own addressing stuff.

You just strobe RAS every so often, regardless of the row presented on the
address lines? Are these simm's marketed as hidden refresh, or is it
just part of some new standard all simm's use?

> I saw 16meg simms that could be used in the 8-bit for $50.... I'm not
> too excited about spending $50 for something I really have no use for,
> but if someone out there in 8-bit land is willing to finance the
> project, I'll build them a 16 meg Atari.

Sounds interesting, but how would you control all those banks? :) A couple
of 8bit latches? It would be nice to not have to use up all the
lines available inside, but I guess that would not be compatible with
anything already used to the only method.

Any idea on where I might find more information on dram refresh? I've looked
around on the net but the most i've come up with is come microcontroller
stuff that pretty much amounts to the cpu-refresh scheme.

Thanks for your help :)

Steve

```
It's been a long time since this was posted. Maybe there's some new blood in
the group who can provide updates. Please send any missing cart numbers,
corrections or omissions to this list. Thanks!

================================================================================
= Cartridge List for the Classic Atari 800/XL/XE Computers =
================================================================================
= Rev. 3.2 December 21st, 1997 =
= =
= Author: Andrew Krieg krieg@execpc.com =
= =
= This list is also available via the WWW at: =
= http://www.execpc.com/~krieg/VidGames.htm =
================================================================================
= Welcome to the Classic Atari Computers Cartridge List! This list is based =
= on a list originally started by Kevin Chase. Many personalized versions of =
= Kevin's list started to pop-up, so I have attempted to consolidate every =
= bit of data I could find into one list. I hope you find it useful! =
================================================================================
= Key =
= ------ =
= * = This cart only runs on 400 and 800 model computers. =
= rso = This is a right slot only cart, exclusively for 800 computers. =
= kbo = Keyboard overlay was included with cartridge. =
= tb = Works with Trackball controller. =
= tf = Works with Track and Field controller. =
= tt = Works with Atari CX77 touch tablet device. =
= kp = Works with Koala pad device. =
= ppt = Requires Chalkboard Inc.'s Powerpad Tablet device. =
= alp = Works with the Atari CX75 light pen device. =
= klp = Works with the Koala light pen device. =
= lg = Requires the Atari light gun controller. =
= 48 = Requires 48K of RAM to run. =
= 64 = Requires 64K of RAM to run. =
= 2 = This cart requires 2 joysticks to play. =
= + = This cart was released more than once in different cart cases. =
= ~ = Multiple versions/releases were made for this title. A special =
= list of these carts is included at the end of this file. =
= <none> = No catalog # for this cart =
= ACE = Amiable Computer Enhancements =
= CPS = Consumer Products Service, a division of Atari. =
= =
= [C] = Checklist for cartridge ownership =
= [I] = Checklist for instructions ownership =
```

```
= [B] = Checklist for original box ownership =
= =
================================================================================
= The rarity ratings are still undergoing fine tuning. I would appreciate =
= any feedback on them. It should be noted that common carts for the Atari =
= computers are harder to find than common 2600 carts. They would probably =
= rank as uncommon or rare on the VGR 2600 list. =
= =
= Rarity =
= ------ =
= C Common These carts can be found fairly easily at thrift =
= stores, in sale posts on the 'Net, or in Atari =
= computer vendor catalogs (yes there still are some =
= vendors!). =
= U Uncommon A little harder to find, but they pop up on the 'Net =
= infrequently. =
= R Rare Very elusive to find carts. Some vendors still have =
= them in stock, but they are generally more expensive. =
= ER Extremely These are very, very hard to find. They usually have =
= Rare had a very low production run. Consider yourself =
= very lucky to come across one! =
= PR Prototype Never formally released. At one time, these were only=
= available as pre-release carts. Now, several vendors =
= are burning new copies of these prototype games. Not =
= as rare as they sound anymore. =

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

I have enjoyed reading this post!

My primary machine is a TI-99/4A, and it does pretty much everything you do with a "home computer". We have recently gotten a 800, and between the Atari and the TI, we have a wealth of educational software /firmware that blows away anything I've seen in the peecee world except for glitziness.

Not to step on anyone's fingers (too hard), but does anyone here subscribe to the "classic computers" mailing list? I did for a while, but all those people seemed to be interested in was collecting "obsolete" systems for the sake of collecting. I asked upon a few occasions whether anyone actually USED their relics for practical purposes, but it seemed at that time it wasn't high on their list. The typical response was, "I collect old machines; if I want to DO something, I use a peecee like everyone else. Why don't you join the 20th century?"

It's mighty good to see that people are actually USING the old dogs for what they are perfectly good for - almost everything!

Especially educational titles for preschool/elementary children. That's what I use my Atari 8-bit for! (Just to stay on-topic!)

2276. Re: SECAM Ataris?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-03 00:00:00 UTC
From: bluesky6@ix.netcom.com
Message-ID: <34fe52d7.6555206@news.newsguy.com>
Source record: 65335

Some French 800XL were sold WITHOUT a modulator.

There was a peritel interface but all you get is monochrome.

I bought one in 1985-86.

It's no wonder Atari lost out to Commodore & Amstrad for the 800xl and later 130XE : how to sell a machine that only had monochrome?

Ben

You're lucky. I have a French 800XL (bought sometime in 1986). And it doesn't have a modulator. Output is only monochrome.

It was my first 'real' computer (in the sense that I bought it with the 1050 diskette drive).

I've not yet figured out how to get colour from it.

Ben

jmouchmino@aol.com (JMouchmino) wrote:

%It seems the SECAM computers can only display 128 colors because of different
%chroma/luminance settings.
%The colors are not the same and you have a loss in picture quality.
%On some SECAM 130XEs, you have some red ''bars'' on the screen and the picture
%can be somewhat blurred...
%I was told, though, that the image could be made much clearer than it usually
%is.
%The SECAM 800XLs seem to be a lot better.
%I actually got my SECAM 800XL in 1984 and bought a PAL version about six years
%ago and I never really noticed the ''fuzziness'', but believe me, I can really
%feel the difference now!
%Unless you want them for your collection, my advice is to never buy SECAM
%Ataris!
%By the way, I know that the Voice Master (COVOX) were imported to France in two
%different versions; I remember trying to load a demo of this program on my
%SECAM XL and it just wouldn't work, while it would run perfectly on my PAL
%system!
%To run the new and not so new Polish demos and some European games, you will
%REALLY need a PAL system (both NTSC systems and the current emulators have
%problems dealing with them).
%A PAL system will run ALL American games, albeit slightly slower.
%Greetings from France,
%Bertrand.

Isn't that just to put the pins for Chroma and Luminance together to get colour Video output ? I think so, but ain't sure. Take Atarian care

>> Anyway to to save the reports you design?

Well the manual suggests you could send the report to disk instead of
to the printer. Columnar reports are under the lists option. If you
send it to drive 1 the data will be written to your data disk. It
says you can send it to drive 2.

As I glance thru the manual, it looks like a lot of swapping between
program and data disks, formatting of disks possible only on drive 1
etc.

Modify your 800XL to have the chroma-luma capability. Atari had
chroma-luma capability in all 8-bits they made ecxept for the 600XL
(no monitor port at all) & 800XL. For some unknown reason I think the
luma pin is unfunctional. Anyway, do a mod (ask around for one, easy
to do) to get that luma back. Connect the Luma plug into the
composite monochrome monitor. Should work. No color goes without
saying.

I think we have had enough fun at his expense, so to answer his question...

What you have is most likely Microsoft WRITE, not WORD. Microsoft dropped
support for this product within a year of introducing it. They reasoned that
if the
Atari users were not willing to support Microsoft they would not support
Atari.
This was the result of really bad reviews of the software, and a general
bashing
of the product by those that claimed to have purchased it.

I have not seen a copy of this in years. You would do much better by
getting
yourself a copy of WordUp.

Don't be silly, the SECAM Ataris were NEVER EVER monochrome!!!!!!!!!!
Except if you had a black and white TV set...
If you have a TV set accepting SECAM signals, you WILL get color right away through the Peritel!
And 99.9% of the programs that run on a PAL system will also run on a SECAM computer, albeit with less colors and a slight loss in picture quality.
Greetings from France,
Bertrand.

>

I don't know anything about the cart being offered, but as a kid I remember seeing an Atari 800 in a store that had a constant demonstration going. It would display pictures and text bragging about all the neat things the computer could do. One neat demo had the 800 calculating the trajectory for the first Apollo moon launch, completing the calculations (including some nifty graphics) in under a minute. The program pointed out that the NASA computers assigned to this task took months to calculate this data.

Message-ID: <34FCA49E.399D6EC7@erols.comX>
Source record: 65344

Ok,

I figured out what was going on. The 800XL has such bad chroma/lum output I couldnt see the display when I hooked up my monitor cable. I then tried my 130XE and it worked fine. I then retried the 800XL and turned the brightness up 100% on the monitor and it worked.

As for my other post, I got the printer to work with Atariwriter 80 through my 850 by disconnecting and reconnecting all the cables, go figure?

Now,
Anyone know where I can get another monitor cable? My local Radio Shack doesnt carry these 5pin Din connector cables anymore.

2286. Re: P: device numbers

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-03 00:00:00 UTC
From: Doc-o@webtv.net
Message-ID: <6dibm5$qd6$1@newsd-123.bryant.webtv.net>
Source record: 65345

With the introduction of the 1200Xl (and subsequent XL's and XE's) the OS was changed to allow addressing printers as Pn: ala addressing drives as Dn: (n being = 1 - 8).

From the 1200XL OS System Manual Supplement to the ATARI 400/800 Tech Ref Notes, Chapter 5, General Enhancements to the REV. B OS Functions, page 24: " The printer handler has been changed so that it will process the unit number in the IOCB, allowing separate addressing for printers P1 through P8."

From COMPUTE!, Issue 73, Vol. 8, No. 6, (June 1986), page 112: (For XL's and XE's, not 400 or 800) "Two major drawbacks:

(1) all printers still respond as P1: or just P: ...

(2) only the following printers have these secondary numbers (NOTE: At that time the XEP80 had not been introduced):

Any printer attached via an 850 P2:
1025 P3:
1020 P4:
1027 P5:
1029 P6:

The XEP80 added more possibilities. From the XEP80 Owner's Manual, page 8:

Printer attached to parallel port P1:
Any printer attached via an 850 P2:
1025 P3:
1020 P4:
1027 P5:
1029 P6:
XMM801 P7:
XDM121 P8:

Sorry, I couldn't respond sooner. I moved recently and had to unpack to find some of this info.

Try this for Rainbow (which, btw, started out on the Mac :):

http://www.shenleyfields.demon.co.uk/rainbow.html

There is also a new one called "Wacke" (for "Weightless Atari Computer
Keepsake Emulator) at this URL:

http://www.ctaz.com/~msdei/mac/mac.html

The best place for info about any emulators for Macs is emulation.net.

Other than null-modem cables for transfering files, no one has come up
with anything similar to APE or SIO2PC for Macs :(--yet.

The solution is a scrollable 640x400 display, which should be passable for
1-bit dithered graphics and fonts.

Scrolling is what the Atari does best.

Message-ID: <34FDF669.B46588F7@sisna.com>
Source record: 65290

Sparta Dos 3.3c is now available in Cartridge form from Video 61.
Give Lance Rinquist a call at 612-462-2500.

No need to load a disk just plug in the cart and follow the instrucions,
comes on a 16k cartridge.

Lance also supports all the old stuff from the 2600 era to new stuff
being developed today.

New 2600 games IE:
Sea Monster, KLAX, Pick N pile, Dice Puzzle, Gostbusters II, My Golf,
Bobby Goes Home, Mr. Postman, Mission 3000, Space Tunnel, Open Sesame
Dancing Plates, Snail Against Squirrel, and many more items. Prices may
exceed the Atari 8-bit users budget but if you want it he possibly has
the item in stock. He does now take Visa/Mastercard and American
Express
can't find it anywhere else give him a call.

bob

If you want to create a new .ATR image from a bunch of files, use
'unix2atr.' Of course, if you don't run Unix on your PC, then you'll
have to compile it under whatever system you do use, which may involve
some porting.

A new Mydos? I know Charles Marslette made a rom version
called RDOS(I have it here somewhere), that was version 3.x,
and never updated. It'll be interesting to see if a newer
version has appeared.

Ibm format CD-ROM for the Atari 8-bit is now avaiable throuh either
Video 61 or K-Products.

The new cd-rom has many old shareware/public domain software available
but the latests version 1.1 has documentation files, for the Atari 8-bit
from A-Z not available before this date.

Price is the same either location..$20.00 plus 3.00 s/h. enclose a copy
of this when ordering.

I have up for auction (all ending on Saturday evening) the 6 different early 80's classic computer equipment. Current bids are between $5 and $26. Pictures for all items are included on their auction description pages:

* 2 Different Atari 800 XL CPUs +1 Power Supply
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=7218842

* 2 Different Commodore CBM C2N Cassette Drives
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=7217487

* Commodore VIC-20 + Data Master Tape Drive
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=7218160

* Atari 1050 Disk Drive + 1010 Tape Drive + 1PS
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=7218471

* Tandy Radio Shack TRS-80 Color Computer 1
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=7219276

* Tandy Radio Shack TRS-80 Color Computer 2 64K
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=7219487

If the above links don't come thru, try this address instead, it'll redirect you to my current auction page:
http://rrnet.com/~bfrandse/auctions.html

I also have the following other electronic toy items for auction there as well in case you're interested, their current bids range from $5 to $20.50:
* Radio Shack Computerized Arcade Tabletop Game
* GAF Melody madness concentration handheld
* Radio Shack LCD Baseball handheld w/Box+Ins
* TomyTronic Flourescent Electronic Tennis Handheld w/Box + Ins
* Parker Brothers Merlin Handheld Game w/Inst.

* TI Speak & Spell w/Word Stumper Module (Raised keys)
* TI Speak & Spell w/diff Word Stumper Module (Flat Keys)
* TI Speak & Read with workbook (Flat Keys)
* TI Speak & Math (Flat Keys)

* 3 Simon games by Castle, Radio Shack and Tiger
* V-Tech Wizard + Mini Wizard LED Simon Games
* Milton Bradley, MB Simon + Pocket Simon Games
* 3 Misc Simon like handheld games by Tiger, Sears
* 3 Misc Pong Units: Radio Shack TV Scoreboard + Wonder Wizard

Thanks for your interest!

All items are up for auction on the "eBay" auction site. I cannot accept bids on your behalf, you must place them at the links above. Registration and bidding on eBay is totally free.

Bill

re: Inertia...

Does anyone know if the Inertia MOD player will work on NTSC Atari systems? If not, it just adds reason to get a PAL chip. I wonder if I get more scanlines with PAL (I wrote a quickie program once that put as many scanlines on the screen as possible, and I got 231. Add one more scanline and the top of the screen warped).

I play games (naturally) but I'm also working on an analog synthesizer program. I like the Atari sound and hope to create a decent synth emulator along the lines of a mini-modular design. I also have been looking for drum machine software to use the Atari in a band (yes, live!) I found Techpop from Analog which I like, but I imagine there are more out there (any suggestions are welcome).

The Atari is an unusual, great machine. I intend on using it for years.

Essentially, the DOS either keeps two tables-the real drive dat table, and a
list the points to the correct drive when a number is used(ask for3, but it gets
changed to 7), or it just swaps the entire drive data entries around as needed.
I don't know about SpartaDos, but Mydos will let you set the Ramdisk to any
number you need, 1-8, replacing(not swapping) any existing drive.

Yeah, in fact all the SECAM 800xl I saw back in the 80s didn't come with a modulator.

> There was a peritel interface but all you get is monochrome.

Huh? Certainly not. If your TV set was SECAM and had a peritel(SCART) interface, you got vivid colours, not monochrome. Are you sure you're TV is not PAL?

> I bought one in 1985-86.
>
> It's no wonder Atari lost out to Commodore & Amstrad for the 800xl and
> later 130XE : how to sell a machine that only had monochrome?

Atari lost out to CBM and AMSTRAD when J. Tramiel bought Atari. Atari used to be very competitive in terms of marketing here in France, until 1984. You could see Ataris everywhere (even in some Club Med villages and on TV shows) and they were very popular (although not as much as the Apple //e). From 1984 to 1985, Atari France just disappeared from the scene (and let AMSTRAD rule the French home computer market). In 1986, they made a big push with the STs. That's another story, though.

That's just my remembrance of the home computers golden age in France.

I can't believe everyone is having so much trouble with this concept. PAL,
NTSC and SECAM are different TV standards. They are not compatible. If you
have a PAL Atari, you need a PAL TV, ditto for the others.

Many modern TVs have different variations on multistandards and will work
or do a partial impression of working. An example is that a couple of
years ago, many TVs sold in the UK would not support NTSC properly but
would sync to 50 or 60hz so you got a picture but it was letterboxed due
to the different number of scan lines.

Of course, if you go via RF as opposed to composite or whatever then you
have another set of hurdles, many TVs in the UK support NTSC and SECAM via
SCART leads or phonos but can't handle it via RF.

Yes, I know that there's difference in PAL/NTSC. But I had an old cable
that was not connected on the pin with the color signal and therefore only
the greys came thru. I made another cable and it was colors. I have NTSC
130XE which of course can give problems to my PAL equipment, but it works
on my PAL/NTSC Sony TV, but not on the RGB/Composite monitor. I just
thought it was the same cable problem I had. Take Atarian care

(Asks which assembler run on a (stock, I assume) 400.)
Only the Assembler Editor cart, I suspect. And you'd have
to use tape drive, like the setup Phillip Price first used
to program A8 on, in a hut by the beach, made (oh, can't
remember) Made some pretty neat game with that setup,
save to tape, run. I bet he got pretty good at making
his code work the first time!

Well... actually... depending on what you mean by "formats read/write-able
by both machines..." there is, SORT OF, a common format: the MS-DOS
floppy. One can put CrossDOS on the Amiga, and a Black Box with Floppy
Board with 3.5" floppy drive on the Atari and run CSS' "BBXFER" utility.
It's not as convenient as having, say, a commonly-recognizably-formatted
HD online on both machines at the same time -- but "SneakerNet" is quite
adequate especially if the Amiga and Atari are sitting side-by-side.

The really fun part about this is that it can go further. I can
read/write MS-DOS floppies on my wife's Macintosh, using "Apple File
Exchange," and just discovered that I can read/write MS-DOS floppies on
the SPARCstation at my new job!

(There are even two ironies here. The first is that the ONE kind of
computer I DON'T currently have access to, is a real, true, PC -- the one
computer out of the bunch on which MS-DOS is "native!" The second is that
the Black Box and Floppy Board that I'm using to read MS-DOS floppies on
the Atari, are those which I bought from Willy himself, a couple of years
ago! Hi Willy! The BB is working GREAT! :-))

Hope this helps...

I don't know, but this is just a thought. You speak of DRAM refreshing. Instead of dealing with the continued problem of keeping the memory refreshed as is required by the Dram. Why not use a SRAM ? Actually it could be much better alternative. No refresh..... faster writes and reads. Yes there are the down side of COST COST COST. I have been toying with the idea of building a meg unit that hangs off the PBI bus. The cost of doing this would be the loss of internal basic, though I do believe that there is another way that I can do the switching without loosing basic. My friend is tugging at me to do this. Right now I got a drawing of a unit that I would like to make that is about the size of 2 cigarette packs. It is a 1 meg unit with bi-directional buffering. I have also thought about adding a colck unit to it. Anyway like I said this is just a thought..

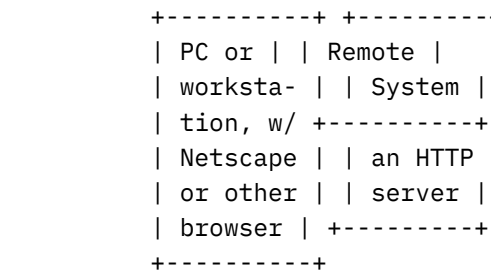
>drawn will take all night. Okay, I'm exaggerating.

You'd almost never NEED to do it that way.

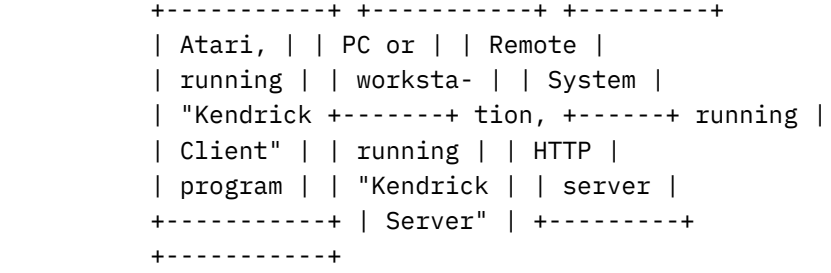
First you get a Black Box or equivalent, which lets you run a modem at
9600 baud (the highest speed I've personally verified) and AFAIK maybe
even higher. Maybe Bob Puff or someone else will find a way to retrofit
the BB for 56K. :-)

Then you create the scheme Bill's been trying to explain. People
seem not to quite understand the idea, possibly through lack of a
diagram which I know provide:

Ordinary Web-Browsing:



Atari-based Web-Browsing w/Kendrick Proxy-Server:



Atari, running "Kendrick Client" program
PC or workstation, running "Kendrick Server"
Remote System running an HTTP server

Now, here's what happens. In the "ordinary" case, as you know, a
"browser" program runs on the PC-or-workstation. The browser accepts
users' keystrokes and mouse-clicks, and sends appropriate HTTP requests to
servers running on remote systems "out there somewhere" on the Internet.

The servers respond by transmitting, via HTTP protocol, various types of data -- primarily, or "wrapped in," HTML. The browser interprets the incoming data and displays it (or starts up a "helper" application) as appropriate. That's all there is to Web-browsing; the "hard parts" would seem to be "interpreting HTML" and "speaking HTTP."

Note that, for the most part, the servers DON'T KNOW and DON'T CARE what kind of browser they're speaking to: they can ASK, for special purposes, but for most intents-and-purposes it doesn't matter. As long as whoever contacts the server, "speaks" proper HTTP _to_ the server, the server happily spits out appropriate HTTP, and assumes that the "contactee" will know what to do with it.

In the "Atari-based" case, instead of running a "browser" program on the PC, we run the "Kendrick Server." This is a program which, like a browser, knows how to "speak HTTP" to remote servers to make requests and receive responses. The only difference is that, instead of accepting users' keystrokes and mouse-clicks, and itself displaying the data received from the HTTP server, the "Kendrick Server" acce keystrokes and mouse-clicks from, and delivers display-data to, the "Kendrick Client" program running on the Atari! Presumably a "Kendrick Protocol" would be used for this purpose.

If the Atari were capable of displaying the full number of colors, and the full resolution, of webpages as a PC or workstation can do, then the "Kendrick Server" would have very little work to do indeed: it would be a very simple "two-way forwarding" program which merely facilitated communication between the Atari and the HTTP servers. This, I think, is what people such as Mark Newton-John are picturing, when they point out that "a 120K JPEG would take hours," etc.

But, of course, the Atari ISN'T capable of displaying the full number of colors, OR the full resolution, of a webpage as a PC or workstation can. So the "Kendrick Server" intercedes on the Atari's behalf. Instead of simply "forwarding" the data received from the HTTP server, the "Kendrick Server" "repackages" it into something the Atari CAN handle. Specifically, the "Kendrick Server" maintains in memory a representation (bitmap, or whatever is appropriate) of "what the display would look like, IF I were really a Web browser," and at intervals it scales this down, and/or reduces/alters its colors, and creates a representation that the Atari CAN handle: 8K (Graphics 8 full-screen size) or less, in however many colors the Atari is using (2 for Graphics 8; 4 for Graphics 7.5, perhaps more if the "Kendrick Client" uses APAC or similar tricks).

I imagine the "Kendrick Server" will only relatively rarely be called upon to scale-and-transmit an ENTIRE PAGE to the Atari. Very likely, the "Kendrick Client/Server Protocol" will include the capability for the "Kendrick Client" to request display of a particular region of the current page, at a specific resolu- tion, then simply provide the Atari user with "Zoom In/Out" buttons and horizontal-and-vertical scroll bars. The "Kendrick Client" program could handle SOME of the Zooming-and-scrolling,

"on board" the Atari by manipulating graphics modes and display lists -- and whatever its necessary limitations, when the "Kendrick Client" reached the limits of what it could do LOCALLY, it would simply notify the "Kendrick Server" to take over and, say, transmit a new piece of the webpage.

This is all entirely feasible. Inventing the "Kendrick Client/Server Protocol," and writing a "Kendrick Client" and "Kendrick Server" capable of using it to communicate, would not be dparticularly difficult. Writing a "Kendrick Server" capable of speaking HTTP, and of interpreting and rendering HTML, JPEG, GIF, etc., would be a chore, but not an impossible one; much, maybe even most, of the code is probably already written and available online somewhere, as part of one or another public-domain or shareware browser (I recall something named Mosaic). But it could all be done.

In fact, if you're willing to accept a few compromises on the PC or workstation running the "Kendrick Server," it might be possible to ENTIRELY ELIMINATE the need for the "Kendrick Server" to do ANY of those difficult things I mentioned, i.e. speaking HTTP, and interpreting all those document-and-image formats! How about a "Kendrick Server" of more general capability, able to "snapshot" the contents of windows put up by OTHER applications, and able to "stuff" external keystroke-and-mouse events INTO other applications? You could then run your favorite PC-based browser, and just let the "Kendrick Server" "look over its shoulder" and relay a copy of the screen, as already described, to the Atari running the "Kendrick Client." You wouldn't have to update the "Kendrick Server" to keep up with changes to HTML or browser technology; a window would still be a window and you could still look at it. Best of all, the "Kendrick Server" could latch onto ANY application, not just your Web browser: you could look at ANY window/app on the host system! Of course you'd want the ability to SUPPRESS that ability, at times, in the interest of security... :-) The REAL beauty of this approach, though, is that it lets both the "Kendrick Server" AND "Kendrick Client" programs be EXTREMELY SIMPLE -- once you figure out how to grab snapshots of other apps' windows, and stuff events into other apps, anyway.

I don't konw how to do those things under, say, Windows -- but I know it can be done because products like "Remote Control" exist which allow one PC to operate another remotely in EXACTLY the manner we're after. I DO know how to grab window-content snapshots under X/Motif, and have seen hints that stuffing keystrokes-and-mouse-operations into other apps is also not particularly difficult. Why, I think I'll just have to try WRITING the doggoned thing!

Bill, what do you think? Want to try it? :-)

2335. XFormer 98

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-04 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <01bd478e$bbf0f1e0$75c2accf@asharkis.erols.com>
Source record: 65375

A while ago I promised a little more info on my experience with XFormer 98. I was truly disappointed upon its first run because it caused my PC to hang whenever I wanted to change a disk assignment.

I wrote to Darek Mihocka about that problem and the rough sound I was getting and he responded very quickly. In a series of messages back and forth, Darek concluded that the sound was a problem of sound card latency and varied from one sound card to another. It didn't seem to be affected by processor speed or memory usage.

The hanging problem was caused by something to do with the the program looking for SCSI devices, something my PC doesn't have. Darek actually sent me a revised .exe of the program that took care of that problem.

I know there has been some bashing of Emulators, Inc. and its owner in the past, but this time there seems to be a favorable turn-around. If you have the problems I had when you get your copy, write to him or look at his website for a bug fix or update.

Now, if I can only find the time to give XForner 98 a thorough test ...

I saw the 8-bit cartridge list posted just recently and noticed that both Bristles and Boulder Dash were listed as being released on cartridge. How long were they aout on Cart, what were the requirements, and where might I be able to get a copy on cart??? I have both games on disk from back in 1984 or so, but on cartridge would be so much better!

Did First Star make the cartridges, or did some other company?

There were actually three First Star Software titles available on ROM:
Bristles, Boulder Dash and Flip And Flop.
Astro Chase was edited by First Star Software on disk and tape but Parker Bros.
bought the rights for the cartridge version.
Bristles, Boulder Dash and Flip And Flop are quite rare, so consider yourself
lucky if you manage to find one of these!
I have Boulder Dash and Flip And Flop on ROM, complete with box and
instructions, but I would only trade them for something unusual.
Greetings,
Bertrand.

Let me ask you something.... you say you can issue commands to the modem... do you see the modem's respons to your commands issued in command mode? In other words does it say OK and stuff? Try ATI0, ATI1, ATI2 etc. Do they come back with results you can see? If so then you have the capability to get data from the modem. If not... maybe the receive data line is not right on the cable.

Try to set your modem to use error correction, but not compression. Also, force your modem to behave as a 9600bps modem. See your modem manual for commands. If you need a hand, and your modem is Rockwell chipset based write back and I can give you some commands to try.

You can read and write directly to your drive using the ProSystem
software and Pro cable. It works much like an x1541 cable does for
the c-64.

I concur. If you ever actually _used_ MS Write and got any kind of
decent output, you're a far better man than I. Write was way worse than
worthless (damn! what's a synonym for than that starts with w?). Even

Word Writer would be better, though WordUp is a good replacement.
Personally, I would go with a cheap copy of Calamus 1.09n or Pagestream.
They're overkill, but they're cheap!

Why Gates would ever think that users of computers with a Digital
Research based OS would use an MS product is beyond me...

Dan

I like the idea, but wish it was available for the Mac. After all, serial input/output has been the standard way to access printers and other peripherals other than SCSI on the Mac. Wouldn't it be cool if a connector could be made to access the input port on the *front* of the 850 rather than accessing data from one of the serial interfaces on the back. If the SIO2PC does this already, I apologize, I'm not familiar with the specs.

I'm curious what everyone's favorite Atari 8-bit games are. Here's my list:

Encounter!
Necromancer
Return of Heracles
Drelbs
Bruce Lee
Enchanter (lots of Infocom, really)
Mig Alley Ace

Probably more, but that's off the top of my head.

Hi...

I have been experimenting with the XL-it emulator, and as a once avid Atari user (I still have my 400, 800, and 800XL) I have been curious about converting my hundreds of disks to an XFD images that I can use with this emulator.

Have any of you figures this out? I have siocopy and psiox, but I don't know what format they write to. If you don't have an answer, do any of you know the specs for the XFD format, and the raw data formats coming from the above packages. I am an experienced PC systems software developer, and I was once a very good atari programmer, and if I can wrangle enough time, i can develop something if I can find the specs.....

Please Email me at bbroer@one.net .

Thanks
Brad Broerman

Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit,rec.games.video.atari

I have an 800XL and 130XE that have been sitting around without a power supply (yeah, same 'ol story..). Yesterday, I found a power supply (Part No: CO 61982). Unfortunately, when I turn the 130XE on I just get a blank, red screen. The 800XL just gives me a blank, black screen.

Do these machines need a cartridge? I thought BASIC was built in? Or is there a problem? Is the power supply fried? There's definately power, and a video signal output...

Any suggestions? Keypresses don't have any effect. Am I missing something obvious?

Hope it isn't too late, but heck if it is then maybe save ya grief
next time, but you shouldn't go plugging in power supplies to
equipment unless you KNOW there is a match. Volatge level, DC or AC,
and if DC then also polarity, as well as the supply's sustainable
amperage output must be observed. If not, you can fry equipment.

I'm not sure which power supply that part number means.

Disable hardware flow control in your modems internal configuration. The 850
interface does not support it.

The correct command on my modem (rockwell) is AT&K0

If that isn't in the FAQ it should be. :)

(A couple guys discuss having problems using an 850.)
I would slow your modem down to 2400 baud, then see how it
works. (Can I remember?) NO (had to look it up). ats37=6
and atn0.
If that doesn't cure it, I don't know.
Probably that will cure it. Then slowly increase baud rate.
I don't think you'll normally have much luck above 9600
or even 4800.

Naw, that's the right power supply, and it only outputs one voltage.

The red screen symptom sounds a lot like what happens when a 5200
fries its RAM.

Wonder if you can get them to kick into the diagnostic mode by holding
down the option key when you power up.

The 850 pinouts (at least for R1 port) show a CTS and and RTS line....
is it just that the handler ignors them or is the rev 1.0 of the 850
manual I have incorrect about those signals being present in the
hardware of the 850?

The only way I could do that was to download the syncromesh software
to the drive first, then superdos would work with it fine.
Since I now own the source code to superdos, I could modify it, but it
is extreamly complex self modifying code with very little in the way
of comments.

My 800XL went red when the Antic chip fried. I replaced it and it worked
great.

Brad,
There are a couple of ways to do this. First off, don't go with the
..XFD format, use .ATR images instead. Now, get a copy of A.P.E. and an
SIO2PC or A.P.E. cable. The cable connects your SIO port to a PC's
Serial port. Atari Peripheral Emulator (A.P.E.) will allow you to MAKE
the disk images and copy files/disks to the resulting .ATR images (Even
boot disks).
Another way (how I happen to do it) is to d/l a copy of PC Xformer 3.60
or buy the new PC Xformer for Win95 and buy/build an XF cable. This
cable connects a real Atari floppy drive to the PC's parallel port abd
allows you ro read (read only!) Atari floppies via PC Xformer and save
directly to premade/copied .ATR disk images.
Either way works pretty well, but I'd really recommend A.P.E. for best
results. I happen to use PCXf as my regular emulator.
What I'd like to see (and maybe already available) is a PC based
program and interface that would allow direct read AND write to Atari
Floppy drive(s). The program should be able to create .ATR images of
almost any size and be able to copy BOOT disk info. It must be
SpartaDOS/MyDOS/ AtariDOS compatible too! Something like A.P.E. but for
the PC and direct connect Atari floppy drive.

I mean, the thing. I can't edit your 'from:' address, so I post
here.
XLit. You probably have no boot record on that .atr games disk
image. I would guess. Or, if there is a boot record, you should
start xlit with the command atarixl -nobasic.
The ROMs should work, again with -nobasic when you start,
and no disk in d1:.
I dunno.

Let me explain my situation: i bought the Indus in Mexico, here, the drive
came with DOS 2.5 not DOS XL, i think as i own an Indus i 'have the rights'
to own the syncromesh software, if i'm right would anyone of you have a copy
in .ATR?? did xl made into P.D. can i get it in UMICH???
Thanks for you time

2379. Re: SIO2Mac Cables? Emulators?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-05 00:00:00 UTC
From: John Morgan <jwmpc@earthlink.net>
Message-ID: <34FE551C.3A7E6C4D@earthlink.net>
Source record: 65327

I thought that the SIO2PC *was* essentially a null-modem cable. What does it do different that makes it so great? Does it use the Atari as a sort of super peripheral? And the big question is: who would produce such a device, or how do we produce such an effect for the Mac? Thanks for all the advice, though I have had some difficulty using a games disk from emulation.net. I guess that I have to convert it using the disk utility provided with the Rainbow demo. Going to try the WACKE emulator next. All this is kind of hard to keep working at when I've got a working 800XL right next to the Mac, but it *is* nice in a strange sort of way. Guess I'll have to read more about APE to find out what it exactly does.

Is this a mega-image (~1MB) ?
AFAIK you should use a dos-image for d1 (mydos??.atr?),
and games002.atr for d2.

March Auction - Update 5

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, March 16 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Atari 5200 Cartridges - New in Boxes

2386. MyDOS documentation

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6dnv0nib1@dartvax.dartmouth.edu>
Source record: 65145

I'm looking for documentation on the info that MyDOS stores in the boot sectors for version 4.53. I found the 4.51 source code, but it doesn't seem to agree with what I'm seeing with 4.53. What I really need to know is what values are dependent on the density, number of sectors, whether DOS.SYS exists, and so forth (I also need to know what those values mean, of course).

A pointer to the 4.53 source code would probably be enough for me to find the answers; is that available?

2387. schematic for the XE game system

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: tom_cody@one.net
Message-ID: <6dnvq5$i7j$1@usenet46.supernews.com>
Source record: 65146

does anyone know of a site that has the schematic for the XEGS, I would rather not have to buy it just to track does were pin 16 on the 6520 goes. The trace goes under the chip and out the end along with 6 other traces. If not I guessI could get my meter out of storage but finding it could take forever.

2388. Chroma/Luminence on XEGS

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: asl00@eng.amdahl.com
Message-ID: <EpDpou.K13@ccc.amdahl.com>
Source record: 65147

Does the XEGS have chroma/luminence output? I read about such upgrades to the XLs but can they be applied to the XEGS as well?

Thanks in advance.

well, as i am not a hardware-freak...

if my informations are correct, sio2pc does nothing more than
converting the volt-levels from 12v to 5v and vice versa...
i think atari uses 5v and pcs 12v on the modem (seriell)-port

i use this wonderful hardware connected to my ATARI 1040 STE ;)
and not to a PC... :) and it works wonderful...

bye, heaven/taquart

[re webtv]
>Oh? Crashing in the middle of an email? Losing stuff? I think it has to
>be user error, or a computer down the line in transmitting the email.

Apparently it was a hard hang in the middle
of creating (typing) an email. I don't see how it
could be "user error", because if the system
"can't crash" (as you asserted), there would
be no user action which could crash it, and hence
no such "error" could do so. (Unless you simply
mean "user error" in the sense of "misreporting
something that wasn't really a crash".)

I've never even _seen_ a webtv, so I'm afraid
I can't be more coherent about it than this.
For example I have no idea what happens if
you have phone line problems and lose carrier.
But she definitely has had to "reboot" it.

Of course, in the PC world, your differing
experiences would be easily explained: bugs
often only affect certain users, because they
are setup sensitive. Since all wetbvs are
the same, it's definitely more odd. Perhaps
she simply exercises features in a manner that
you never do, which is certainly the classic
way of encountering software bugs.

Regardless, all crash/bug reporting is anecdotal;
you can't get a sense for how "crash-proof"
a given item is without collecting samples across
a large number of users.

Sorry to go so far offtopic anyway.

Sean

2399. Re: SIO2Mac Cables? Emulators?

Source record: 65158

It's a lot more than a null-modem cable, and SIO2PC software or APE
software used with that cable turns the PC into a super peripheral for the
8-bit, not the other way around.

The cable converts voltage levels to and from the SIO so that they are like
RS-232 signals going to and from the PC's serial port.

The software, in both cases, allows the PC to use its RAM, hard drive, etc.
for additional ramdisks/storage for the Atari using virtual disk images
(.ATR extender.) They also allow pass through printing to the PC's
printer, and in the case of APE, allow the use of the PC's modem which has
to be faster than the Atari's. APE provides many more conveniences.

Dan,

> Why Gates would ever think that users of computers
> with a Digital Research based OS would use an MS
> product is beyond me...

The problem wasn't that Microsoft Write (or more commonly known as "Microsoft Wrong") was a MS product --- the problem was that its was BAD software (even by Microsoft standards). About the only way that Atari could help promote it was to give it away for free by bundling it with its systems in the late 80's.

As an Atari dealer, I found it much less aggrevating to REMOVE it, throw it in the trash can and substitute Word Writer in the bundle before delivering new systems to buyers. There's nothing worse than delivering a new Atari system to a customer and then having to try to explain why he or she couldn't get the bundled software to work properly and have face needless hours of total frustration.

Atarians didn't buy their systems to have to face that kind of aggrevation. We EXPECT our systems and software to install and work easily and properly WITHOUT having to read exhaustive manuals, 'made-easy' books, or undergo hours of needless frustration.

Most ANYTHING would be a better choice for word processing than Microsoft Wrong!

Sheldon (Computer STudio - Asheville, NC)

ATARI 800 with 2659+ games and a 386 PC

Atari 800 with PC 386 file server 1050 disk drive(with INTERNAL APE prosystem)
410 tape drive, 19 carts, 2 tapes, and a SIO2PC cable(built into Atari 800) and a 386
COMPAQ computer to run as a file server for all 2659+ atari games

the PC computer is as follows
Desktop Case with power supply
System is 386SX-20
120 MB Hard Drive with APE (software to use the INTERNAL sio2pc cable
and over 2659+ atari games)
12 MB of memory
5 1/4" and 3 1/2" floppy drives
Built-in vga hookup
2 COM ports, 2 printer ports
PS/2 hookup for mouse and keyboard

APE is shareware but has most of the features and will allow you to use
any of the atari software on the 800 from the PC I STRONGLY suggest
registering APE doing so will allow faster load times and will removes
all nag screens

800 has 48k of memory, the 410 is in the orginal box
2 working joysticks

carts include:
Basic
Centipede
pacman
qix
miner 2049er
galaxian
donkey kong
asteroids
defender
MS Pac man
Facemaker
Dig Dug
Missle Command
Pole Position
Joust
KinderCop
Star Raiders
Jumpman JR.
Star Trek

TAPES include:
Shamus
Hangman

All necessary power cords and connector cords are included

MAKE OFFER

I agree with a few of them... you forgot games like AR: The City and The Dungeon or Phantasie I and II.. Zybex, Draconus, mirax Force, beachhead II, Archon.... actually the list goes on and on and on....

Get a copy of MENU.ATR from Yogi's jellystone site or wherever else you
can find it. Put MENU.ATR on drive 1, put games002.atr on drive 2.
games002.atr is a megaimage. I know, I have it.. boot drive #1 from Xlit
and you get a menu that shows you all the games, about 2 screen fulls..

2408. 600XL:16K to 64K Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: rldetlefsen@delphi.com
Message-ID: <JBQq40M.rldetlefsen@delphi.com>
Source record: 65167

As requested, here is the diagram to upgrade a 600XL to 64K.

This is excerpted from a Michigan Atari Magaznie article by Don Neff(MACE, WAUG).

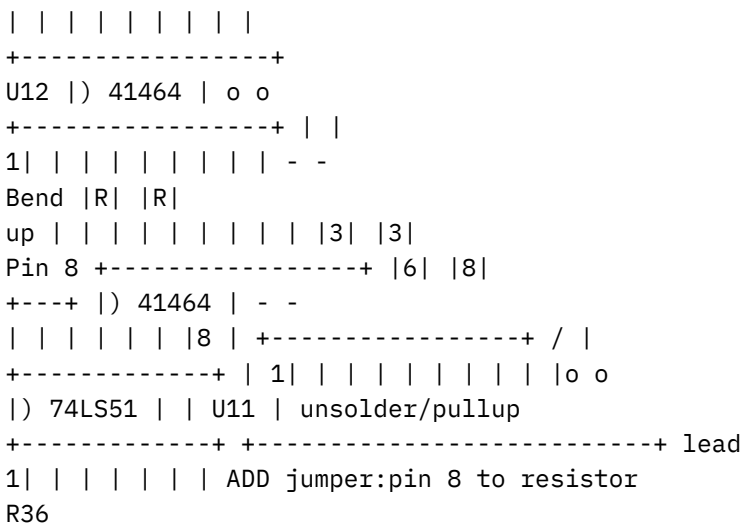
This is the upgrade in its simplest form. If you do not understand it, don't do it. You assume all risk, but I have used this several times and it works just fine.

You need: 2 41464-10 64K X 4 bit Dram chips, sockets optional.
some hookup wire, soldering iron, and tools

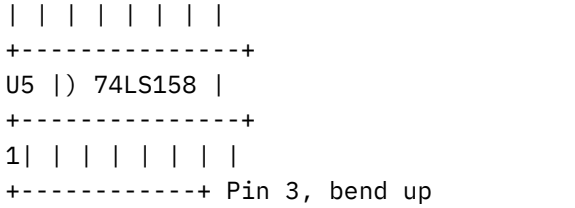
Open the case and remove the circuit board. With the cart port at the back...

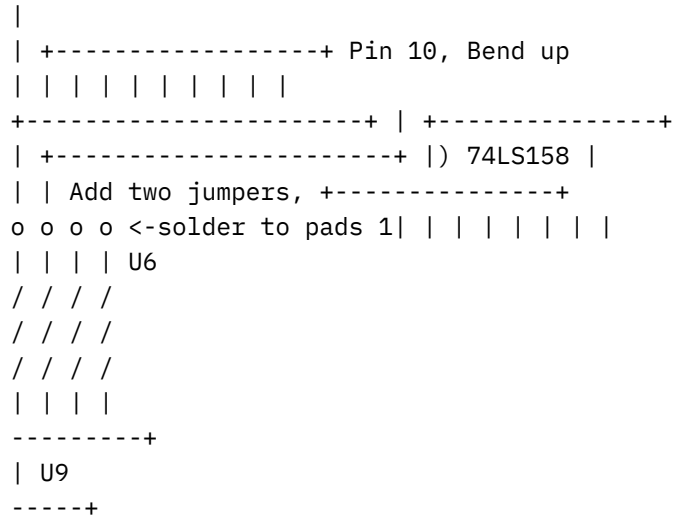
Replace the 2 16K drams. They are U11 & U12. If they are socketed, then Great. If not, carefully unsolder them, the fine traces are on top! Pull up the (3)pins and fold over the fine lead, pull up the resistor lead. Unsolder as needed. You may want to tape the resistor/jumper. I.C. notches go left.

RAM:(Replace 2 dram chips, add jumper):



ADDRESSING(add 2 jumpers):





You are done. Test the board, FRE(0) should be about 37K.
Reassemble.

Is there an end? If you play to the end-level it
starts again from the first level - at the next difficulty-level.
I don't know what comes after the final difficulty ...

Just to clear things up.... both of ya's were right. D1: is disk
device 0 as far as the drive select switches go. Binary you know is
0s & 1s. Two bits is value ranges from 0 to 3 rather than 1 to 4.

Hey, If the machine does indeed have a bad memory chip. Holding down option to get to the internal diagnostics, will have no effect. You really will need a good O-scope or the Salt cartridge diagnostics to check out the problem. I do fix all modles of the 8-bits for a flat fee of $35.00 plus shipping. I warrant all repairs for 180 days from the date of repair. If you want futher information drom me e-mail at dwmoar@teleport.com

2415. Building new Atari hardware

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6dplq8$kl0$1@dartvax.dartmouth.edu>
Source record: 65174

I've been mulling over the idea of building new Atari 8-bit hardware. I really don't have the expertise or resources to do so, but it is an interesting idea.

For building new computers, how hard would it be to recreate Antic, Pokey, and GTIA functionallity with generic parts (PALs or commodity CPUSs)?

Perhaps more useful would be to build new disk drives. I'm thinking that it would be cool to take a standard PC floppy drive and build a custom controller that spoke SIO, and would read all the old formats (90K, 130K, and 180K) as well as standard PC formats (pretending that each 512-byte sector was really two 256-byte sectors). It should be possible to fit it into a 1050 case.

Of course, one big question that comes up with that is whether the limitation of PC drives not being able to read FM (i.e., single density) disks is a matter of the hardware or the controller.

Thoughts?

Good question, how many difficulty levels are there? I'm going to have
to get the disk out tonight and pop it in the Atari 800 and see. I'd mes
with training it myself, but as it is the original..... Probably copy
protected.....

What is APE?

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA

Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance

in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing direct memory access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Today Atari Games is an indirect, wholly-owned subsidiary of the Midway Games division of WMS Industries.

WMS Industries Inc.
3401 N California Ave
Chicago IL 60618-5899
USA
http://www.wms.com/

Midway Games Inc. (a division of WMS)
http://www.midway.com/

Atari Games Corporation (a subsidiary of Midway Games)
http://www.atarigames.com/)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge

Interface (ECI), continuing the powerful feature of direct memory access.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and
supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

JTS Corporation

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer...

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.78979 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
60 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

ANTIC Mode #	CIO/BASIC Graphics #	Display Type	Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12 ++	Char	40 x 24	5
5	13 ++	Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14 ++	Map	160 x 192	2
D	7	Map	160 x 96	4
E	15 ++	Map	160 x 192	4
F	8	Map	320 x 192	1 *
F	9 +	Map	80 x 192	1 **
F	10 +	Map	80 x 192	9
F	11 +	Map	80 x 192	16 ***

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following text was written by Chris Crawford and appears in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls

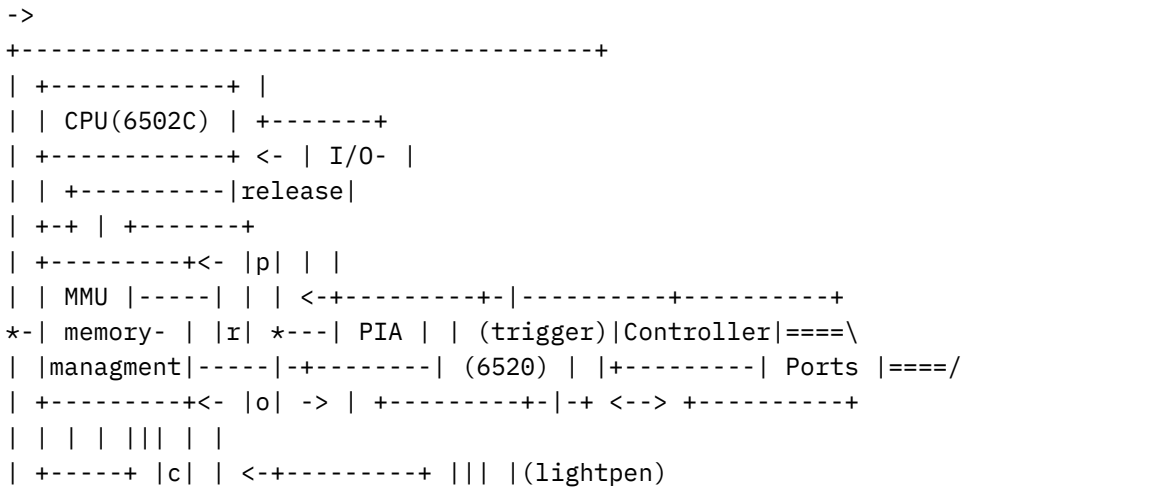
most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

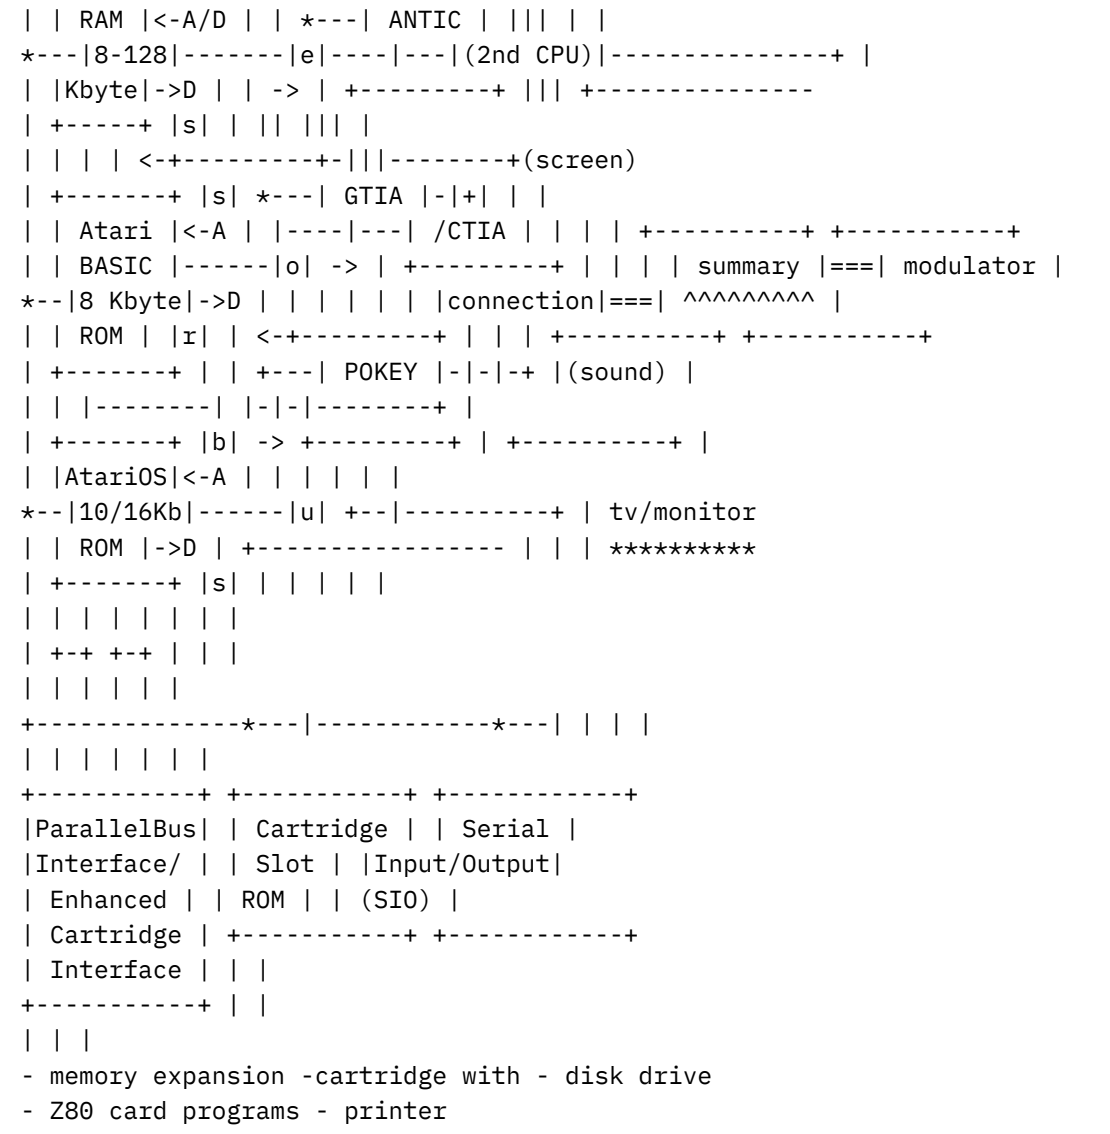
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

Hardware Arrangement (With thanks to mailto:peter@soemtron.sb.sub.de (Peter))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800:8/16/48K,1200XL/800XL/65XE/800XE/XEGS:64K,600XL:16K,130XE:128K
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home
Computer Club" in issue 3 - Summer 1983. The magazine was the official

mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an

acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design, and if you look at the middle logo [MLOGO2.BMP], you will be able to make out both letters.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Atari related hard/software announcements. (Moderated). Dead newsgroup? Moderated by Yat Siu, mailto:lexicor@world.std.com

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.1) What is INFO-ATARI8?

INFO-ATARI8 is an e-mail list for discussion about the Atari 8-bit family of computers.

To subscribe to INFO-ATARI8, send a message to:
mailto:listserv@vm.marist.edu
that says:
subscribe info-atari8

Owner= HARRY@MARIST (A Harry Williams)

comp.sys.atari.8bit postings no longer appear in INFO-ATARI8.

INFO-ATARI8 was created on December 9, 1986.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

atari8-l mailing list

created especially for discussion about ANIX project (unix for atari8), but any atari 8bit related threads are welcome. english language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

there is also mail2news gateway that translates all postings on the
list to easy to read usenet articles, available read-only to everyone at:
news://zwieracz.pse.pl/listserv.atari8-l

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.pse.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.pse.pl

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by
mailto:kendrick@zippy.sonoma.edu (Bill Kendrick), designed to provide much-
improved access to the various PD/freeware/shareware Atari 8-bit software
archives available on the Internet.

XL Search is located at: http://zippy.sonoma.edu/kendrick/nbs/xlsearch/

You can also access XL Search via e-mail! Send mail to:
mailto:kendrick@zippy.sonoma.edu with the subject "xlsearch" for details.

mailto:kendrick@zippy.sonoma.edu (William Kendrick) himself writes:

http://shareware.com/ , c|net's FTP-site search engine, now includes
the Atari 8-bit files at UMich!

Unfortunately, being under the previously-existing "Atari" category,
the files are now pretty mixed in with the ST stuff. I've talked to them
about fixing that. No reponse yet (they're really slow that way)...

Anyway, so now you can use http://shareware.com/ to find Atari stuff..
just be careful what directory you pull it out of! :)

Remember, you can ALSO use MY MINI VERSION OF SHAREWARE.COM!....

XL Search, the Atari 8-bit FTP site search engine!
If anything, it's much less cluttered than Shareware.com! ;)

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of files for many computing platforms, including the Atari 8-bit computers. For more information:

Bill Kendrick, mailto:kendrick@zippy.sonoma.edu (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich Archive. The Archivists request you use these mechanisms in this order of preference:

1) The number one way to get into the UMich archives is via AFS. If you have AFS, all our files are kept in the directory "/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT! Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/ Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory. Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/

ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://ftp.toad.net/pub/umich/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You might also suggest what permanent 8bit subdirectory you'd like your file to end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no (Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate directory. Please include a readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff
from all the world. Also, you can download big amount of slovak and czech
programs for 8bit Atari only from this archive. And finally, because this
site is created and supported by slovak computer group GMG, most of our
products can be found right here.

If you want to place here your program, just send it to me (with some
comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

The Cleveland Free-Net now has a home page:
http://cnswww.cns.cwru.edu/net/easy/fn/

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British
Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:76702.1076@compuserve.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename

extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has

no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to

person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.geocities.com/Hollywood/Lot/4205/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No

Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but

]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format

disks, and is currently the best bet for reading SS/ED 128K Atari-format disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050 drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

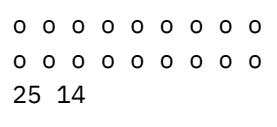
A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.



(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready

5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 11.5) What is SIO2PC?

Original text by Dave Paterson, mailto:davepat@total.net

SIO2PC is a cable and software combination that lets you use your PC as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to
16 megs. SIO2PC also lets you redirect the printer output to your PC
printer or to a file on the PC. High speed drives are emulated (a la US
Doubler).

All these functions are transparent at the Atari end; you never notice the
difference between SIO2PC and regular drives, except that the SIO2PC drives
are faster than any others (except Ramdisks and PBI interface drives).

Several different designs for the SIO2PC hardware are floating around. Best
contact the author for the latest details.

SIO2PC 4.16 is shareware by Nick Kennedy, mailto:nkennedy@cswnet.com

---

Subject: 12.1) What 5.25" floppy disk drives are available?

SS SD

==> Trak ATD2
SS SD/DD
Built in Diagnostics. Track indicator. Write protect switch. Built in
parallel printer interface. 2k printer buffer (expandable). Optional
Turbo software on Eprom.

==> Trak AT-1
SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic

- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades (CSS)
- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (76702.1076@compuserve.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at
one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

The pinout of the Monitor port is in the pinout section of this FAQ list.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the 800XL lacks separate chroma/lumi (can be added via hardware modification)

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\lumi signals

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using

the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests,
and in newsgroups like this one. Plus, many new TV's support S-Video
and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness
(luminance) signal. These are passed to the monitor port as Chroma and
Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal
which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the
process of being "modulated" into a TV radio signal (channel 3 or 4).
This step involves removing high frequencies from the video (blurring
it) and sending it to the TV in a fragile broadcast form that's
suseptable to all kinds of interference. Then the TV must (1) extract
the video signal from the radio signal, (2) separate the Chroma and
Luma components as best it can, then (3) divide the Chroma in R, G,
and B. Any of these steps that you can eliminate will help your
picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is
probably the Commodore 1702 which has a very good picture and is quite
reliable.

If you plan to use an XL (which I do), upgrading the video circuitry
makes as big a difference as what monitor you choose. Ben Poehland has
some excellent articles in Atari Classics magazines for improving the
quality of the XL's video, as well as restoring the missing Chroma
output."

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce
fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a
SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum
outputs are run into an onboard encoder to produce a "psudo" color depending
on the Luminance output, composite only. This is why a SECAM VCS or 800 has
nowhere near the same number of colors (16) availible as a PAL or NTSC unit
(256).

The FGTIA was never completed as the market size did not warrant the expense.
The largest SECAM market is not France but the Soviet Union (former) and in

80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/developer list). SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI

800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions. 410a - Taiwan
version
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I software
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions

600 600XL, all black case
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
1250XLD Earlier name for the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" floppy drives
1450XLD 1400XL plus 5.25" floppy drive
1600XL Amiga/Amiga-like????
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1055 -a 1050 (SS/ED) with a 3.5" mechanism

1060 CP/M Add-On Module -Z-80 CPU, 64K RAM, CP/M 2.2 OS, 80 column display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz
==========

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that

performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

o Carina BBS -- a product of Shadow Software. See Vendor list to contact.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:offen300@hio.tem.nhl.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's inside your Atari and compare them with the numbers from the following table:

Part#	Version
CO12402 + CO14502	A
CO60302A	B
CO24947A	C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:offen300@hio.tem.nhl.nl

The following Operating Systems exist for the Atari 8-bit:

Rev.	System(s)	Models	Size	Part Nr(s)
A	NTSC	400/800	10kB	CO12499B, CO14599B, 12399B (*)
A	PAL	400/800	10kB	CO15199, CO15299, CO12399B
B	NTSC	400/800	10kB	(?)
B	PAL	400/800	10kB	(?) (*)
1	A NTSC/PAL	1200XL	16kB	CO60616A, CO60617A
1	B NTSC/PAL	1200XL	16kB	CO60616B, CO60617B (?) (*)
1	NTSC/PAL	600XL	16kB	CO62024
2	NTSC/PAL	XL/XE	16kB	CO61598B
3	NTSC/PAL	XE	16kB	C300717
4	NTSC/PAL	XEGS	16kB	C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Breakout, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor.

Thanks to mailto:jlodoen@shell.portal.com (Jeff M Lodoen) for initial info.

Subject: 13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines,
but software designed on PAL machines (Europe) won't necessarily work on
NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines
displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they
refresh the screen 50 times a second doing 1/2 the lines each refresh
so they effectively repaint the screen 25 times a second. NTSC is
525 lines/screen with a 60 times a second refresh - again only half
the lines each refresh so a 30 times a second frame rate. This
would change the amount of time available during vertical sync pulse,
and the number of lines that need to be redrawn each time.

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard
dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 13.13) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

==
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include;
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, email-to: offen300@hio.tem.nhl.nl
==
There are quite a lot! To get some structure in this section it's
divided into the following catagories;
a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]

Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]
Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).
- 6502 Cross-Assembler "xa", 1997 (Andre Fachat) [D]
written in GNU C.

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]
- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]

- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]
Package includes; compiler, linker and assembler.

e) LISP
- INTER-LISP/65, Version 2.1, 1981 [D]
(Special Software Systems, DataSoft)

f) FORTH
- ValForth (Valpar International)
- Extended fig-Forth (APX-20029)
- fig-Forth, Version 1.1 [D]
- fun-Forth (APX-20146)
- Grafik-FORTH
- QS Forth (Quality Software)

g) PILOT
- Atari PILOT, 1980 (Atari) [C]

h) LOGO
- Atari LOGO, 1983 (LCSI, Atari) [C]

i) All the rest
- Action!, 1983 (OSS) [D/C]
- Quick, Version 2.0, 1990 (Raindorf Soft) [D]

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all

of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Alley Cat Synapse
Apple Panic Broderbund

Subject: 13.17) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

---

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

Trevor Holyoak, mailto:trevor@holyoak.com maintains the "Atari BBS List."

http://www.holyoak.com/atari/

Subject: 14.3) Where is my nearest 8-bit Atari user group?

Rich Tietjens, mailto:atari@teleport.com maintains an Atari computer user group list at:

http://www.teleport.com/~atari/ugbbs.htm

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

See: http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

in Spanish: http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.espanol.txt

If you'd like a text-only copy, simply send e-mail to mailto:kendrick@zippy.sonoma.edu with the subject:

send emulator faq

Subject: 14.5) Can I use an emulator to run my old Atari software on my new computer?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

See: http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

If you'd like a text-only copy, simply send e-mail to
mailto:kendrick@zippy.sonoma.edu with the subject:

send emulator faq

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by
David A. Paterson, mailto:davepat@total.net or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:nadkar@fh-pforzheim.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin,
mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

2418. MIO vs. BB

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: mathy.van_nisselroy@stackbbs.xs4all.nl
Message-ID: <889231879@stackbbs.xs4all.nl>
Source record: 65177

Howdy folks

Re: MIO better than BB

I've got a BB (+FB and Spooler), what
I know about the MIO I've heard from
other people.

On the BB, if you go into the menu,
the file you where running is still
there when you get back. The MIO
menu overwrites whatever is in
memory.

The MIO did NOT have the 80 column
option. It was planned, but never
released, not even prototypes.

Many, if not most MIO's would get hot
and unreliable. I've even heard of
people glueing coins (nickels) to
chips inside the MIO.

The MIO has a cool case (I've seen
one once, very nice). The BB has
none. You can buy this black thing,
but it's UGLY.

One thing I don't like about the
BB/FB combo is that it's not fixed
together firmly. And if you really
press it together, the ends of the FB
point up a bit. My solution: I put
an extra "precision" socket in the
connection between BB and FB and
bought some nylon bolts, nuts,
bushings and washers (and stuck 'em
in the holes that are already drilled
in BB and FB - three in each board).
This way the air can flow freely
between the two and the FB is held in
FOUR places instead of one.

A yes, and the BB doesn't have
on-board RAM. But it should be
somehow possible to stick some SIMMs
onto the PBI. Why hasn't anybody

tried this??? If you use a BB on the
130XE (and the European 800XE and
65XE) you have an unused socket
(where the cable for the XL PBI cable
is/was plugged in) with all the
signals. And SIMMs are getting
cheaper by the minute. I've seen a
place where 1 MB x 9 SIMMs (30 pin)
cost DM 11 or about US$ 6. They were
DM 14 a couple a month ago.

2419. ICD

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: mathy.van_nisselroy@stackbbs.xs4all.nl
Message-ID: <889231880@stackbbs.xs4all.nl>
Source record: 65178

Howdy folks

At 02:10 PM 3/5/98 -0800, I wrote a message to ICD. This is Thomas Harker's answer:

Me: "Howdy folks

Do you still have stuff to upgrade/repair old hardware you once sold/produced for the Atari 8 bit.

I know of people looking for:

- MIO ROM upgrade (to go from the 256kB to the 1MB version)"

Thomas: "We hava a few MIO boards left and some of the RAM chips. We will have to test them and determine the cost though."

Me: "BTW did you ever release the 80 column upgrade for the MIO?"

Thomas: "No. I am pretty sure all the samples went to Mike Hohman."

Me: "- The GAL inside the SpartaDOS X cartridge. A friend of mine wants to repair his SDX cart but can't find Mike Hohmann/Fine Tooned Engineering. (the company you sold the rights to) It seems like nobody knows where he is."

Thomas: "Yes, we could supply a replacement GAL I think."

Me: "- the Real Time chip inside the RT-C8 cartridge. (I asked this a coupe a days ago, but didn't get an answer yet.)"

Thomas: "We can probably dig up a clock chip or two."

Followed by a message for me and
another reply by Thomas:

Me: "I guess the first thing people
are gonna ask me when I tell 'em is:

What's it gonna cost?

Could you send me the "price list"
plus postage to US and Europe
(Netherlands and Germany)?

Those clock chips, are they designed
by you or are they "off the shelve"
stuff (just in case you can't find
them, sell all of them..)?"

Thomas: "The problem is that we are
extremely busy right now with several
other projects. We do plan to put up
some 8-bit history pages on the web
site as we get more free time. When
that is done, we should be caught up
with our duties. At that time, I
will be glad to find parts, test MIO
boards, and quote you prices.

2420. MyDOS cartridge

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-06 00:00:00 UTC
From: mathy.van_nisselroy@stackbbs.xs4all.nl
Message-ID: <889231881@stackbbs.xs4all.nl>
Source record: 65179

Howdy folks

I sent a message to B&C
ComputerVision concerning the MYDOS
CARTRIDGE they are selling. You'll
see Bruce's reply first, then my
question.

It is brand new just done. I believe
it is 4.x and supports up to 1 meg
RAM disk. We are supplying the
cartridge to the maker and it is the
standard brown Atari 8-bit cartridge
with a simple printed label. We are
not set up to upload pictures yet.

B & C ComputerVisions
Web site: www.myatari.com

Can you tell me more about the MyDOS
cartridge? Like how old is it.
I've heard from Charles Marslett that
he had made a Cartridge version of
MyDOS 3.016. Or actually there were
THREE versions.

Is this the cartridge you are
selling, or is it "brand new"? You
wouldn't happen to have a picture you
could put on you homepage, would ye'?
(or send me :-) if you do so,
please tell me which file I need to
look at/print out the picture.)

BTW I'd be interested if the
cartridge a NEW. (and I know for a
fact that I'm not the only one!)

CU Mathy Van Nisselroy

The cartridge costs $19.95 (ex.
shipping). They recently moved to a

new location and I don't know their
new snail mail address. Their new
EMAIL address is myatari2@juno.com.

Are you sure it was only 128 bytes of ram? I could have sworn that the
TI 99/4a had 16k of ram. The only computer I can think of offhand with a
mere 128 bytes of ram would be an Altair.

Source record: 65083

In my experience with My Amiga 1080 monitor, it was able to
properly display either NTSC or PAL, it was a matter of fine
tuning the vertical hold. Correctly adjusted, it could display
either instantaneously (flipping between PAL and NTSC on the
A500). Is SECAM also at 50Hz? I assume my current
magnavox should be able to do the same thing as the 1080.
The 1080 went flaky after awhile, and I didn't want to mess
with it.

>quite right to talk about e2fs as "Linux".

I'm sure it is corect.Even on my 8k-per-sector floppies it uses 1k blocks.
(obviously the block-size is meaningless here since you must read at least 1
sector which is 4k or 8k)

The other "file systems" exist to read disks from other computers;you're
expected to use the normal Linux DOS for the root and /usr partitions.

>On very large drives, larger blocks will give you better
>performance.

I'm not sure how.On my computer Linux reads 16k at a time so the block size
would seem to have nothing to do with it.If you're really running programmes
that read just a byte at a time or something you can set your pre-fetch to 4k
to get the effect you're looking for.Assuming your hard disk isn't totally
fragmented.

Atari's XIO and MS-DOS/UNIX's ioctl() allow you to perform device specific commands.That's how Atari does what the Commodore does with channel#15 of the disk drive.

Yeh,there are Atari MODEMs that hook directly to the Atari's SIO bus and speak a language specific to the Atari MODEMs (no AT commands).Atari MODEMs are strange in that they don't use XIOs but work more like DOS on the Commodore.

A keyboard overlay?
You mean like on a 400?

>He's got a collection of disk drives, electronics projects,
>old books and magazines. Atarians can only sell this stuff
>to other Atarians. He thinks this is good stuff.

Well,if you're not rich like me and a Atari is all you can afford then it IS
good stuff.Why people want to buy $1000 IBMs to do stuff that us Atarians were
doing back in the 80's is beyond me.

>Well, I can't think of any more, but if you're reading this
>and recognize yourself, you're an Atarian like me.

This almost sounds like a send-up of us Atarians!!!
(I still don't get the "eye facing the wrong way" quip)

>One of the reasons Atari computers did so poorly was because they
>were a cross between a game machine and a business machine. The

That sounds like a plus to me.Anyway it's a computer so it's really just a GENERAL machine.

>Apple II was so successfull because you could get an 80 column
>board for it, use it as a real business machine, and also a game

I don't see what 80-columns has to do with business software.Besides printing 80-column text files.In which case word-wrap can compensate like in TextPro.
(anyway I always printed in 132-columns so 80-columns is useless to me except for BBSes)
And you can thank Atari for getting rid of the old way of using 80-column adaptors.(right cartridge slot and memory upgrade slots)
And don't get me started on the XEP-80.(5x8 characters???)

Have you really played games on the Apple?
Try out Spy Hunter ont the Atari and Apple to see how much of a game machine the Apple is.Or just imagine the Atari with JUST playfield graphics and no P/M graphics,display list or smooth scrolling.And the only sound is the console speaker.(no POKEY? DEAR GOD!!!)

Of course,to be fair,you had those two extra artefacting colours.But they couldn't be mixed with the normal two unless objects on the screen always moved a multiple of six pixels.

>machine. Also software developers took the Apple seriously, as
>well as the IBM PC. Using a TV screen is not anyones idea of a
>business machine.

Actually I always use a TV or composite monitor with the Apple.Artefacting just doesn't work right with RGB.
(inverse text is un-readable in graphics mode on a RGB monitor)
I can use 80-columns alright with my Apple-brand composite monitor.

>I personally didn't want expansion boxes ad-nauseum just to install
>additional cards. Both the Apple II and the PC had the expansion
>within the case, instead of an external box. People obviously
>liked that.

I don't really see the difference with the Apple.You still can't put it on your lap (the keyboard is built-in) with the expansion box built-in.The 1090XL probably would've cause the Atari to take up as much room as the Apple.
(within reason)

>The death nell for our company was Atari choosing to go through
>department stores (Sears, Ann & Hope etc.) for sales, instead of
>the thousands of computer dealers that were selling Ataris one
>month before... It was very difficult to get your producets in to
>these stores, plus, they really didn't have any expertise in the
>products, like the local computer stores did.

That and no 1090XL.
>In my opinion why the PC beat out the MAC as the predominant
>computer of today is because the MACs were not expandable
>internally. Cute, but not expandable. The expandable MAC came too
>little too late, and was still way too proprietary. Whether people
>really need expandability or not, they psychologically really like
>to have it.

Not to mention the premise that all computer users MUST be shielded from
anything actually having to do with computers.At least from what I've heard.
And acording to a Mac book I read,when the Mac says that a file is 5k it's
actually 5000 bytes long!

It was a really strange computer.There was only 128 bytes of RAM.Plus the was RAM INSIDE the video system.But the CPU couldn't see that.So you were stuck with cartridges (which could have 8k of ROM plug "GROM" that only the video system could see) or BASIC programmes,whose symbolic codes were stored in video memory.Not to mention the absence of a STACK!

I'd really like to learn more about this computer's capabilities.I could only use it's text mode with BASIC.

>and
>2. Booted off of. (By connecting it to the SIO or cartridge port.)

The best way to go about this is to make some generic RAM/ROM chip SIO device that various sockets could be easily wired into.

I'd go for the Playstation's memory cartridges since they're 128k.
(bigger ones have to look like multiple 128k cartridges)
The Saturn has some big cartridges.I notice that when mine boots that I see a message from the cartridge implying that a handler is being linked in somewhere.But this might just be for the benefit of the built-in file manager.
Otherwise this would imply no standard way of accessing non-SEGA cartridges.
(and another reason that the Saturn is superior)

On 1998-02-12 The_Shadow@spnt.com said:
>Usually what I do, is start by zeroing all memory above memlo, this
>insures a clean slate in case the program is expecting one, and it
>won't harm anything anyway.

That's already done for you if your menu-loader is being booted rather than ran from DOS.

>Then I go out and read the first 6 bytes of the file, to determine
>first if it is actually a binary file, and the load address and
>length of the first segment. Then I set the run address to the
>intitial load address, just in case the program doesn't set it
>later, such as in some of the Sparta-Dos .COM files. I then set

That doesn't sound like a good idea.Who's going to run SpartaDOS commands from a boot-menu.They can just use PUTRUN anyway.And how do you know when to do this? The first segment may not be meant to be executed from the start.And it may contain only data.(I always did hate that "feature" of SpartaDOS)

>the load buffer area to equal that of the program, and read in the
>first segment directly to where it wishes to reside in memory.
>Since you have already read in the first 6 bytes, exiting if the
>program doesn't start with 255 255, or if end address<= load
>address. Your pointer to continue reading is already at byte seven,
>to continue your burst IO load. You set # of bytes to load at end
>address-begin load address-1.

But if it turns out not to be a binary-load file then you've just read random bytes into a random location.Or else I'm mis-understanding you.

>Now we go back for segment 2, which is a little more complicated.
>Grab next 2 bytes, if 255 255, toss them, and loop back to grab
>next load address, else continue with end address, set buffload to
>load address, and bufflen to end-begin-1. If load address=init,
>jump to init subroutine which will load next 2 bytes into init, and
>jsr through init, and then go back to second part of loader routine

But a init-address can be loaded with a segment that has a run-address since both can be loaded with one 4-byte segment.You should really just clear the init-address,load the segment,and then check if the init-address has been altered.Best not to second-guess.

>else continual loop through second part of loader routine until EOF,
>or end address <= load address. After EOF established, jump to run.
>Burst IO will give you a MUCH faster load, and also eliminate the
>need to strip the last 3 bytes of each sector, or decide which DOS
>was used on the format etc.

If you're not using DOS then the concept of "burst I/O" is meaningless.
All I/O done through SIOV is burst I/O.

>>padded to the end of the first sector) Then, it loads the next
>>sector in the line, which does not have a $FF $FF at the
>>beginning of it because it is a raw sector dump, incrememnts the

Even if it wasn't a raw sector it probably still wouldn't have $FFFF at the
beginning of each sector/125 bytes unless all the preceding segments were a
multiple of 128 bytes.(minus the room for the 4/6 byte header)

>> -> I've seen a few files that assumed that they were loading on
>>top of -> zeroed-out memory. Anytime they have a block of more
>>than 4 zero -> bytes, they split the block into two blocks to
>>save space in the file.
>> -> This probably works with DOS, which will buffer and copy the
>>data if
>> -> the entire sector isn't being read, but not with menu loaders
>>that -> will read the sector in place and copy from there. I
>>expect that the
>> -> programs would still run, but they would look funny as it
>>would be -> graphics data that would be compressed in that manner.

I'm not really sure that I understand what you are saying.
If DOS loads two non-contigous segments it won't bother the data in between
in any way.So unless you've just booted and DUP doesn't load into that area
it will fail with DOS too.Also binary-load segments have nothing to do with
whether all of a sector is used.Unless you've appended to the file since you
download,unARCed,copied,or re-created the file in any way,only the last sector
of the file will not be fully used/loaded.
(this doesn't apply to MYDOS's append function)

One has to do with DOS file structure,the other with the data that the file
contains.

But BASIC really has nothing to do with DOS.You're just using it like a
telecomm programme.It doesn't even qualify as a command line interface (CLI)
since that's actually inside the disk drive.It's like saying that BobTerm is
part of Express because it ferries data to and from it.

Actually Atari disk drives have "format" built in.All DOS has to do is write
out a updated VTOC (like the Commodore's BAM) afterwards.
(but some drives leave garbage after a format ruining this simplicity)

Ah, gee I forget who was talking. (Mathy van Nissleroy?).
Anyways, if you have a BB or a MIO, you're in the elite
as a A8 collector/user.
I've heard nothing but good things about the BB and floppy
board.
However, I own two MIOs, 1 256k and 1 1 meg, and never
had a problem (well, the MIO to PBI cable needed replacing,
but that was my fault for 'tugging' on the cable, I quit
that.)
Where was I. Consider yourself EXTREMELY lucky if you
have either.

2443. Auction: ANALOG/Atari Explorer/Many 8-Bit Items

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-07 00:00:00 UTC
From: clauction@aol.com
Message-ID: <19980307144200.JAA04321@ladder02.news.aol.com>
Source record: 65103

March Auction - Update 6

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, March 16 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Atari 5200 Cartridges - New in Boxes
1. Keystone Kapers. New in box (unsealed) -$4.95 min

Atari 5200 Single Cartridges

2444. XEGS parts for free

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-07 00:00:00 UTC
From: warerat@neosoft.com
Message-ID: <35015f8e.74038781@news.neosoft.com>
Source record: 65104

I have found a XEGS system that was taken apart in one of my scrap boxes. Has keyboard, MB, case halves. If anyone wants it, its yours for the price of shipping.

warerat@neosoft.com

2445. Re: MIO vs. BB

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-07 00:00:00 UTC
From: The Shadow <The_Shadow@spnt.com>
Message-ID: <6drtpqqhv1@news.chatlink.com>
Source record: 65105

I've been running MIO's since they first came out, and find them quite reliable and trouble free for the most part. The main reason I have never even considered switching to a Black Box is the lack of looks, and no ram. I have my computers in my office, and I would be ashamed to let my customers see one with a black box attached. Not to mention the only one I ever owned was very flakey.

The Shadow

2446. Re: MyDOS documentation

>boot sectors for version 4.53. I found the 4.51 source code, but it
>doesn't seem to agree with what I'm seeing with 4.53. What I really
>need to know is what values are dependent on the density, number of
>sectors, whether DOS.SYS exists, and so forth (I also need to know
>what those values mean, of course).

Density isn't stored anywhere.The number of sectors is stored in the VTOC.
(sector#360)
You can get the sector-size with a "GET STATUS" SIO command to the disk drive
so that you know how many bytes to expect.
That's all the information that MYDOS really needs.
As far as I can tell,MYDOS just assumes that the first 720 sectors are normal
DOS 2 format and anything beyond that is MYDOS format.
Dual density 130k disks formated with DOS 2.5 look like 90k to MYDOS.
(because DOS 2.5 puts a VTOC at sector#360 reading "720 sectors")

>instrucions, comes on a 16k cartridge.

So DOS gets copied into RAM and the cartridge gets switched out?
That seems like the only way it would work to me.
16k seems like a lot.What else is on the cartridge?
IS it a ROM disk like SpartaDOS X?

Net-Tamer V 1.10.1 - Test Drive

2448. MYDOS cartridge from B&C:details needed

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-07 00:00:00 UTC
From: dklugh@iwaynet.net
Message-ID: <6drvoc$u9m$3@news.iwaynet.net>
Source record: 65108

SO how does this MYDOS cartridge work?
Can you use another cartridge at the same time?
(like a cart game that needs DOS or a language cart)
Does it have a UltraSpeed handler?
Does in contain anything beyond DOS.SYS?

Net-Tamer V 1.10.1 - Test Drive

2449. Using the 8-bit with music education

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-07 00:00:00 UTC
From: *rlcolli*@ibm.net
Message-ID: <HxYA1kimRJKQ092yn@ibm.net>
Source record: 65109

I teach Intermediate General Music to grades 3-5, and I would really like to use the 800XLs that I have piling up! (A school near me had an auction, got about 5 XLs, 1050s, and monitors for about $10!)

Anyway what software would anyone recommend to use. I was thinking about AMP, but it might be a little cryptic for the younger grades. I was also thinking about using Music Construction set (if I can find a copy... I know I had it at one time, but where...) Points of interest that I am looking for:

1. Create music
2. Drill and practice
3. Learn about music

If I was using a Mac or PC, for number 3 I would create my own materials in either HTML or Hyperstudio. I can't think of anything like these that work on the 8-bits. I've thought about using Adventure Creator though. (Maybe a Hyperstudio clone would be a good Internet programming project?)

TIA!

>they just don't scan down any lower than 31khz, typically.

Actually almost all of my cvomputer monitors are composite,not RGB.

So when they say that you can use RGB monitors with these modern game systems
does that mean that I can use my multi-sync monitor that's attached to my PC?

>: Why not just have a SCSI port so that you could plug in hard disk
>: drives,graphic systems and anything else you wanted/needed?
>Because it's not a full computer. If they tried to turn it into a
>Java box, this might make sense.

That answer is sort of arbitrary.Why not have SCSI devices?
Since most modern SCSI drives report their configuration (like Atari drives do)
it would seem simple to hook them up to a game system style computer.You only
have to know the configuration when you make the file system structure.Then it
would be saved to the boot sector or something.

There was a good article on Atari's history in one of the mainstream computer magazines a year or so ago that talked about that fact in more detail (sorry, I can't remember which magazine it was, but I probably still have a copy of it at the office somewhere if anyone's interested). From what I remember, Microsoft couldn't produce a Windows OS within the timeframe Atari required for introduction of the ST. Microsoft wanted a year or so for development, while GEM was essentially ready to go. And, at that time, the Tramiels were anxious to produce a new system to help revive the company they had just taken over and take it back from the ashes of its former glory.

As far as the custom chips in the 8-bit, no. You can't build them with
PALs or other stock chips.

For a disk drive, the 2797 controller chip will run all Atari and IBM
formats, including 1.44. No reason to use 512 byte sectors on the Atari.
The 2793 controller in the 1050 is OK, except it won't do DS drives. Use
the 2797.

Only one voltage? I have a XEGM and it's power supply has a DIN
connector with multiple voltages coming out. I thought the rest of the
XE line had similair power supplies. Wonder why decided to go with the
more expensive power supply and connector in the XEGM?

The power supply for the XL's and XE's uses a 7-pin DIN. Three of the
pins are +5V, and three are ground.

I wonder if anyone answered the question that was asked
a while ago concerning whether the rights to the stuff that
FTE bought from ICD would revert back to ICD if FTE couldn't
complete the payments? I tried calling ICD a few days ago, but
the only time they are there for 8-bitters is when I'm at
work. I would really like to get the last version of SDX,
as it had some really nice features added. ICD could really
help out the current situation by having the newest version
available for sale.

>It was a really strange computer.There was only 128 bytes of RAM.

128 WORDS. 256 Bytes. The 99/4A is a 16-bit computer.

>Plus the was RAM INSIDE the video system.But the CPU couldn't see that.

Not directly, no.

>So you were stuck with cartridges (which could have 8k of ROM plug "GROM"
>that only the video system could see)

GROM is visible to the CPU, but is interpreted, not machine code. So it
doesn't really help you.

>or BASIC programmes,whose symbolic codes were stored in video
>memory. Not to mention the absence of a STACK!

Nope, no stack! You can make one, but REAL MEN do it without a stack :)

Actually, the 99/4A isn't much more than a game machine without the
P-Box (peripheral expansion), or other similar expansion via the
bus port, of which the P-Box is the most common. 32K (we got up to
1Meg expansion devices, now), RAMdisks, floppies, hard drives, RS232,
printer ports, etc. Similar to the Atari 8bit, but all in a single,
massively-heavy card-cage unit.

A label-less copy of Crossfire on cartridge? Offhand I would just guess the assemblers ran out of labels. Maybe they were finishing the last (or only) production run, had more carts than labels, and said 'what the hey.'

It's not like it's defective. I had Crossfire on diskette, though, and it's not a very good game.

Why would it not be possible to build them with PALs, GALs, ROMs, and 8 bit
dacs? I would be willing to bet that the original chip-set was prototyped
using discrete components, no way a machine was around to similate the
chip-set that had the power in the middle to late 70's.

The ANTIC chip looks to be a digital device. The POKEY chip looks to be the
hardest because of the number devices are integrated into one package. GTIA
digital decoding and DA to conversion. Devices in each of the chips need to be
updated every 60th of a second except for sound channels.

Hmm. Does anyone have a complete register list, memory map, and the internal
interrupt scheme for these chips for Mr. Crow?
However, if Mr Wooley meant there are any available one chip upgrades there are

none, except for the 6502 inside and maybe the PIA chip. I say go for it!!!

Bill M.

Is there anyone around from that ACE, circa early 80s? I'm looking for
some of the frequent contributers, particularly Stan Ockers....

Thanks,

Greg

>give it to my son since he could spill liqud on it without killing it.

There are several ways to upgrade the 400. For the work involved, to 64K is
better, and uses fewer chips. There are two ways to bring it to 64K. Modify a
16 K ram board or buy a 64k board already built(this is by far the easiest as
the
first method requires a lot of soldering). I do have a method on paper. I
can mail a copy of it if desired.

All Atari printers respond to P: or P1:. Only some respond to other numbers.
This was hard coded into the printers rom. My list includes:
850 p2:
1025 p3:
1020 P4:
1027 P5:
1029 P6:
820 NONE
825 UNKNOWN
ALL OTHERS Unknown.

One of the big things about getting terminal coms working is setting Echo and/or Duplex correctly in the term program, and in the modem itself. With it off in both, nothing gets to the screen.(Even the remote system can cause this).

> I have a question...when was the first version of Windoze released?
It was announced around 1983 but didn't ship until much later (85/86? -
Microsoft were always late, even then!). Version 1 was dire and nothing
like you're used to now. Looked a lot like GEM i.e. one colour icons
although GEM was far ahead in usability. Version 2 of Windows was a bit
better and used the 286 architecture to multitask and make better use
of flat memory but it wasn't until v 3.0 in 1990 that it became half
useful and took off with Joe Public. V3.1 was better still and came out a
year so after that.

Mathy and James,
I also own a 256K MI/O and have never had it get hot. I'm using a 1050 PS on mine. The guy that sold it to me couldn't fine the original PS. Works great, however, the BB does stuff the MI/O doesn't and that the stuff I'd really like to have. The FB and the archiver stuff would be nice to have. I do like ane use the MI/O ramdisk as a boot disk along with SpartaDOS. I even have it configured so that if I remove the SDX cart, I can boot wirh the ramdisk in SD 3.2d. That works great too.

March Auction - Update 8

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, March 16 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

When I was a child,the power supply of my new Atari 800XL died after some months.The XL only made a black screen and its power LED got dimmer => I cracked the power supply case open and found out that the entire PCB was sealed into white plastics. :[

Because an original PSU was very expansive(and needed a month for shipping?),I bought at an electronics shop a transformer + PCB kit for a standart regulated PSU(+5V?) + case and soldered the stuff together.This power supply is still working fine,although it gets a bit warm.

(By the way,an Atari 400 power supply produces 9V(?) AC voltage and though never must be connected to an Atari XL etc without a rectifier/regulator.)

MAY THE SOFTWARE BE WITH YOU!

Hi!
I just bought an Atari XE-system with a 1050 drive. I was looking for a 800 but it will do wor a while.

I have a lot of ATR files.
I want to play games on my real Atari (not an emulator).

Can I convert the ATR to Atari readable files again ? (Where do I find out how?)

Can I store the files on my PC (CD) and download it to the Atari when I want to play? (Where do I find out how?)

Please make the reply to my email address also.

Telelink I or Telelink 2? Either, I guess. I'm not collecting, I actually plan to use it. I have an 850 and a standard modem.

I guess Telelink II is more advanced, so I'd rather have that one.

Good point. The XL/XE power supply was regulated. Any substitute
power supply must also be regulated.

> > IDE-devices to the Atari 8-Bit, like a harddrive, an IOMEGA ZIP-drive,
> > or an Atapi CD-Rom player...
> Who makes this MSC controller and wher can it be purchased?

The msc controller was made by two German Atarians. Unfortunately the
msc-interface isnï¿½t available any longer because the latest production
run is sold out.

If there are enough orders (>30) perhaps another production run will
be started.
So everyone outside (yes, outside) of Germany who is you are interested
in getting one of these devices should try to get in contact with me.

BTW, I am using this interface on my own and am very happy with it.

Tschuess,
Frank

P.S.: As it is a real parallel-device the MSC-interface only runs on
ATARI XLs (or XEs with interface that is only available from 3rd
parties).
P.P.S.: Modified ATARIs with OS' that have the parallel port support
removed (like Bibomon) are unable to work with the MSC

2499. Atari 8 Bit Fair in Schreiersgruen 98

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-09 00:00:00 UTC
From: schallt@worms.fh-rpl.de
Message-ID: <6e0vvm$bi7$1@villon.Fh-Worms.de>

Hey Atarians,

The Schreiergruen 98 fair is two weeks away.

The following people will be there:

Highlander Soft - R. Altmayer

Kaisersoft - M. Roemer

Charlie Chaplin - A. Magenheimer

RAF - T. Grassel & H. Reminder

TARG - H. Weidner

The Mag - T. Butschke

Me

and possible that you there, if you come from Germany.

Es gibt viele alte Klassiker wie:

Bruce Lee, Lord of Conquest, One on One, The Count, Mercenary, International
Karate, Kennedy Approach, Drope Zone, Solar Star, Questprobe, Gunslinger, Mythos,
AMC Spiele ...

1050, XF 351 Upgrade, Speedy, XC 11-2, Gamesystem, Touch tablet, Kids Kontroller,
Sound Geraete von AMC, Schreibschutz Schalter 1050, Xep 80, Netzteile, Joysticks.
IC`s fuer 1050 & XL/E ...

Es gibt eine grosse Verlosung, wo wirklich jeder etwas Gewinnen kann.

-Man kann Spiele testen, kaufen und wenn man einen Stand hat und
Vorort nachfragt, auch verkaufen.

-Die Kinder k�nnen sich an einem Stand mit Jaguar und XL Spielen die Zeit
vertreiben.

-Es ist in unmittelbarer Naehe eine Autobahn und eine sehr gute Wirtschaft.

-Es gibt nette H�ndler mit ausgesprochen g�nstigen Preisen...

Wer einen Zugang zum Internet hat und auf seinem Rechner einen der diversen
Browsern nutzt, findet bei folgenden Adressen weitere Infos:

http://www.fh-worms.de/~schallt

http://home.t-online.de/home/highland

Wer noch eine Stand m�chte kann sich bei mir bis zum 13.03.98 melden.

BYE

This is one of the things why i like Superdos 5.1, it has some kind of
utility in Aux.sys that reads the controler in the drive, i think that's why
it won't load in an Indus, it simply can't retrive the info from the drive.

Sorry, but while my Commodore 64 loads a programm, i can Format a Disk,
and play about 10 levels of Gem Drop in my Atari, i turn back and the disk in
the 1541 still spinning.... One strong point: the 1541 makes no noise...

You can get Music Painter, i don't know if it is available somewhere or the
rights remain at Atari, it is the simplier music programme i've seen in Atari,
ideal for young kids... btw: i have a copy of it.

Greetings from Mexico

Message-ID: <19980309162501.LAA01672@ladder02.news.aol.com>
Source record: 64963

I hate to sound negative to enterprising ideas, but in addition to the many solid reconditioned Atari 8 bits, B&C Computervisions (and probably other dealers) still offer brand new, never-been-touched 8 bits. Let's face it, there's not a problem yet in supply running out due to demand. As for using higher density drives, many of us are already using all the PC compatible drive capacities by using APE.

You need an SIO2PC or APE cable to connect your PC to the Atari. Use the SIO2PC or APE software on the PC to make the ATR file look like a real disk drive to your real Atari.

There are a programme called Util, don't remember the author, but it writes and reads Atari diskettes 180K long ONLY, and works, as far as i know only in the XF551 disk drive, this far it works for me.

You can find it at: ftp://atari.archive.umich.edu/atari/8bit/ the files are P.D. so you won't have problems about it.

GREETINGS from Mexico.

There are 100's of disk speed-up cartridges and utilities available for the commodore, some of which provide 100% compatibility, and all of which have always been extremely cheap. Any one of these utilities will boost performance far beyond anything Atari dished out.

If you choose not to use one, that's really your own problem, and this makes your argument a little bit invalid. You can choose to use cassette drives too if you want, I guess.

Actually Mark,

You have to take a slightly broader approach, some 8bit hackers built external keyboards onto their 130XE's and 800XL's, a computer (I think it was RCE) used to sell detachable keyboards for both the Atari 400 and Atari 800 computers, then there's Mike St. Pierre's IBM Keyboard interface for the Atari 8-bits as well, so don't just automatically assume that its an XEGS

Curt

>Bill M.

Just to be clear, I'm not going to be building any new hardware--I
don't have the resources, knowledge, or time. I do, however, find the
idea intriguing.

I was also thinking of a hybrid system--an Atari 8-bit card for a PC.
The card would include a real Atari chipset and memory, but provide
for the sound to be sent to a soundcard and the video to a videocard
(either full-screen or in a window, like the TV cards). Special
software on the PC would control things like interpreting the SIO
commands and routing the PC joystick inputs to the Atari card.

Of course, with the steadily-improving state of the all-software
emulators, there's not much practical need for such a device anymore.

I took the original 23 (or was it 22?), extracted all the files,
removed a few duplicates, added in a few of my own files, cleaned up
the .txt description files, and created two megamegaimages. Because
you can only have 64 files in a directory, I created subdirectories
using MyDOS. I have a menu program that is aware of MyDOS
subdirectories; it lets you select a file or directory using the
joystick.

I need to do a little cleaning up, but soon I should be ready to
release them. Where should I put them?

BTW, what happened to Yogi's site? It's been down for over a month
now (ftp.hackerz.com).

> (obviously the block-size is meaningless here since you must read at least 1
> sector which is 4k or 8k)

You are simply wrong and unnecessarily argumentative. 1k blocks are
merely the mke2fs default.

from the mke2fs man page:

MKE2FS(8) MKE2FS(8)

NAME
mke2fs - create a Linux second extended file system

SYNOPSIS
mke2fs [-c | -l filename] [-b block-size] [-f frag-
ment-size] [-i bytes-per-inode] [-m reserved-blocks-
percentage] [-q] [-v] [-S] device [blocks-count]

DESCRIPTION
mke2fs is used to create a Linux second extended file sys-
tem on a device (usually a disk partition).
device is the special file corresponding to the device
(e.g /dev/hdXX).
blocks-count is the number of blocks on the device. If
omitted, mke2fs automagically figures the file system
size.

OPTIONS
-b block-size
Specify the size of blocks in bytes.

[remainder deleted]

> The other "file systems" exist to read disks from other
> computers;you're expected to use the normal Linux DOS for the root

> and /usr partitions.

Sure, but there is no "normal Linux DOS (sic)". You're weaseling.
Linux implements a virtual file system so you're not bound to e2fs if
something better comes along. The e2fs is just a de facto standard.
You could use the xiafs instead, which is different but performs
similarly and just never caught on. You can also use the umsdos file
system to demo Linux on a DOS machine without repartitioning or
reformatting your drive.

If you are really curious about these things, you can always read the
source code.

Hi

Saw the replies and noted no mention of "Edhack" which can be both an accessory and Program. Good old Word Writer St, St Writer, St writer Elete 1ST Word & 1ST Word +

Though Pagestream is great; as a word processor it is clumsy, as is WordUP, Calamus etc (there are others) these are for desktop publishing

Word Writer has both Dictionary & Thesaurus capability is O L D came out when the 1st ST's did but for simplistic writing is fine.

Has anyone checked with Toad to see if they have something good.

Edhack is by far the nicest little editor/word processor

>

I can compare both because i 'have' both, of course, i got an old Compute
mag where cames a program that makes the tape of comie run as fast as a disk
drive, and i've heard about the turbo loaders, but without gimmics (sorry if
i made some misspellings) what you have left is just the old 1541 spinning
forever, and sometimes is worth it because there are some great games in that
platform that never came out for Atari, i think that'w why commie are so
popular; in the other hand Atari made a great sistem that was overpriced for
so long that kill it in the long run. If you want to talk about hardware
upgrades, is fairly easy to find them in both platforms, so i don't care which
computer has the faster hard drive acces, what counts here is the way
Commodore and Atari made the things, the Commodore 64 that i got is very cheap
made, with a paper cover over the printed circuit, that drives me nuts, god
this guys were cheap man, in the other hand my Atari XE is strongly
made into a nice case and with a professional printed circuit, the O.S.
soqueted and a metalic R.F. protector over it. I haven't opened the 1541 but
my old 1050 is lighter and better looking, no talk about the XF551... Let's
finish this right now: I can make transfers between my PC and my Atari without
needed nothing else but the UTIL software found at UMICH, with the comie i
need a little extra, for me that makes the difference, at this time i keep the
Atari because the guys that made it were, IMHO, more professionals that the
guys that put a piece of paper over the Commodore 64....

The glorious thing about the Megaimages is that they are a mixed bag,
when you open one don't know what you will get: you can get a great polish
game like Battleships, or you can get a wierd surrealist piece of software
that nobody likes it.......

ok, ok, not oly US old software, the Megaimages has almost everything in
the binaries directories of Yogi... almost...

> Is this device still available?

He might be referring to teh Transkey adapter, which I believe is no longer
available. I don;t know who made it, so I could be wrong :)

I created a few PC AT->Atari keyboard devices, but the production cost of
each one pretty much makes them a pipe dream since I doubt many people
would pay $60-$70 for a keyboard adapter, no matter how nice it is.

If anyone is interested in the plans I will make them available on my
web page. The original device consisted of a 6507 + 2 RIOT devices +
an EEPROM for keyboard macros. The newer one is based on an Atmel
8052 flash+ee microcontroller.

The 6507 one is a real fun hack, you can built it with the parts from
a couple gutted atari 2600's. :)

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Brad,
Check: http://aegis.mcs.kent.edu/~clisowsk/8bit/sio2pc-1489.html
for the schematics to build an SIO2PC cable. You will also need
either SIO2PC or APE for the emulating software. Never having owned
an ATARI I can't vouch for either of these product, but both appear to
be shareware. APE looks pretty expensive if bought. There is also
some C source which is supposed to perform much the same task
(emulating an ATARI disk drive through a serial to SIO cable),
however, the author claims it's buggy. He is looking for volunteers
to help with the project. A GPL SIO2PC under Linux would be _nice_.

See: http://www.cs.dartmouth.edu/~crow/atari/

I just bought an 8bit ATARI for my collection and look forward to
many happy hours playing with my new toy! However, coming from the
Linux/*BSD camp I do _not_ look forward to buying APE. A concerted
effort towards a GPL SIO2PC package seems the most appropriate
solution here.

>filled 4K of character-memory on a hercules in 2-3/50 seconds.

Have you looked into what would be required to support 16-bit ISA
cards? While 8-bit cards of some types are still available, 16-bit
cards are much more common, and 16-bit support would open up the
possibility of doing drivers for ISA SVGA cards (8-bit VGA cards are
rather difficult to find nowadays).

Even if adding support for 16-bit data adds to much complexity, if you
produce the interface, you might want to consider limited 16-bit ISA
slot support, as some boards use the extended slot only for the extra
interrupts it makes available.

If I read correctly, your current interface offers just a bit under
2000cps to the Hercules card, which seems to be quite a bit better
than an XEP80 can manage. Still, while this is good enough to keep up
with 14.4Kbps, without compression, anything faster than about 16Kbps
would likely result in lost characters. Of course, since the fastest
current serial interface for the Atari 8-bit tops at 19.2Kbps, this
would not seem to be an issue.

Add an ISA-based serial card with a 16C550 port, however, and the top
end gets a lot higher, provided the Atari could actually fetch the
bits as fast as the UART could provide them.

agreements
associated with such games (the "Atari Assets"), to HIACXI, Corp. ("HIAC"), a

wholly-owned subsidiary of Hasbro Interactive, Inc., for $5,000,000 in cash. The purchase price was determined based upon arm's-length negotiations between the Company and HIAC. The Atari Assets were acquired by the Company in July 1996 when the Company merged with Atari Corporation. There is no material relationship between HIAC and the Company, any of its affiliates, any director or officer of the Company, or any associate of any such director or officer.

UNAUDITED PRO FORMA CONDENSED FINANCIAL STATEMENTS

The following unaudited pro forma condensed financial statements give effect to the disposition of the Atari Division which was consummated on February 23, 1998. The accompanying pro forma condensed balance sheet as of November 2, 1997 assumes that the disposition of the Atari Division by the Company took place on November 2, 1997. The accompanying pro forma condensed statements of operations for the year ended February 2, 1997 and the nine months ended November 2, 1997 assumes that the disposition took place as of the beginning of the periods. The pro forma condensed statements of operations do not include the effect of any nonrecurring charges directly attributable to the disposition. The results are not necessarily indicative of what would have occurred had the disposition actually been made at the beginning of each of the respective periods presented or of future operations of the Company.

EXHIBIT 99.1

Exhibit 99.1

ASSET PURCHASE AGREEMENT

THIS ASSET PURCHASE AGREEMENT (THIS "AGREEMENT") IS ENTERED INTO ON FEBRUARY 23, 1998, BY HIAC XI, CORP., A DELAWARE CORPORATION ("BUYER"), AND JTS
CORPORATION, A DELAWARE CORPORATION ("SELLER").

RECITALS

This Agreement contemplates a transaction in which Buyer shall purchase certain assets (and assume certain future obligations) of Seller in return for the consideration described herein. Buyer is a wholly-owned subsidiary of Hasbro Interactive, Inc.

NOW, THEREFORE, the parties, intending to be legally bound, hereby agree as
follows:

I. CERTAIN DEFINITIONS. As used in this Agreement, the following terms have the meaning given to them below:

"Acquired Assets" means the following assets of Seller:

A. All right, title and interest in and to the Seller's Products;

A. All Intellectual Property associated with the Seller's Products, including the Intellectual Property identified on SCHEDULE 1, and remedies past and future against infringements thereof and rights to protection of interest therein;

A. The license agreements listed on SCHEDULE 2 (the "License Agreements");

(d) All of Seller's claims, causes of action, choses in action, rights of recovery, set-off and recoupment relating to or arising out of any right, property or asset included in the Acquired Assets; and

(e) all business and financial records, books, files, plans, documents, correspondence, lists, drawings, notebooks, specifications, creative materials, advertising and promotional materials, marketing materials, studies and reports of Seller, whether written or electronically stored or otherwise recorded if, and only to the extent, that such foregoing items relate to the Acquired Assets (not including the items of this clause (e) for these purposes) or Assumed Liabilities (subject to Section 5(b)).

Notwithstanding the foregoing, the Acquired Assets shall not include the Excluded Assets.

"Assumed Liabilities" means only liabilities and obligations arising after the Closing under each License Agreement actually assigned to Buyer pursuant to this Agreement.

"Atari Hardware Platforms" means the following hardware platforms: Atari 2600, 5200, 7800, Lynx hand-held and Jaguar game system hardware, Atari 800, ST and Falcon 030 computer family hardware, TOS operating system, 8-bit operating system, and Portfolio palmtop computer.

"Excluded Assets" means the following assets:

(a) inventory, receivables, furniture, fixtures and equipment;

(b) any tax assets of Seller, including pre-paid taxes, tax credits and tax carryovers;

(c) all tax returns and tax records whether or not related to the Acquired Assets;

(d) the $45,000 balance of the royalty guarantee owed to Seller on December 31, 1997 by Interplay Productions, Inc. under Amendment One to the Game License Agreement dated July 29, 1996, between Atari Corporation and Interplay Productions, Inc. and as otherwise identified in SCHEDULE 3;

(e) software developed by or for Seller or its predecessor under license of intellectual property rights from a third party or third parties for use on the Atari Hardware Platforms to the extent that such software is not related to or associated with any of the trademarks and copyrights set forth in SCHEDULE 1 or any of the game titles set forth in SCHEDULE 3;

(f) Hardware embodying Intellectual Property (other than Seller's Intellectual Property) that is licensed from third Persons.

(g) all assets associated with or related to Seller's disk drive business.

"Hardware" means equipment, components, circuitry, integrated circuits, processors, casings, layouts (including synthesizable code), mask works, manufacturing data, and all designs, schematics, tooling, formulae, processes, and know how therefor (whether or not any such items are presently embodied in physical components) and related Intellectual Property.

"Intellectual Property" means any or all of the following and all statutory and/or common law rights throughout the world in, arising out of, or associated therewith: (i) all patents and applications therefor and all reissues, divisions, renewals, extensions, provisionals, continuations and continuations-in-part thereof; (ii) all inventions (whether patentable or not), invention disclosures and improvements, all trade

secrets, proprietary information, know-how and technology; (iii) all works of authorship, "moral rights", copyrights (including derivative works thereof), mask works, copyright and mask work registrations and applications; (iv) all industrial designs and any registrations and applications therefor; (v) all trade names, logos, trademarks and service marks, trademark and service mark registrations and applications together with the good will of the business symbolized by the names and the marks; (vi) all computer software including all source code, object code, firmware, development tools, files, records and data, all media on which any of the foregoing is recorded; (vii) Uniform Resource Locators, World Wide Web site addresses and domain names; (viii) any similar, corresponding or equivalent rights to any of the foregoing; (ix) all documentation related to any of the foregoing; and (x) all goodwill associated with any of the foregoing.

"Key Marks" means each of the following marks: Atari, the Fuji logo, Asteroids, Battlezone, Breakout, Centipede, Combat, Crystal Castles, Millipede, Missile Command, Night Driver, Pong, Ultra Pong, Tempest, Warlords and Yar's Revenge.

"Knowledge" means actual knowledge of (i) the senior executives of Seller or (ii) John Skruch.

"Lien" means any mortgage, pledge, lien, security interest, charge, claim, equity, encumbrance, restriction on transfer, conditional sale or other title retention device or arrangement (including a capital lease), transfer for the purpose of subjection to the payment of any indebtedness, or restriction on the creation of any of the foregoing, whether relating to any property or right or the income or profits therefrom.

"Person" means an individual, a partnership, a corporation, an association, a joint stock company, a trust, a joint venture, an unincorporated organization, or a governmental entity (or any department, agency, or political subdivision thereof).

"Registered Intellectual Property" means all United States, international and foreign: (i) utility and design patents, design registrations and utility models and all pending applications (both regular and provisional) for any of the foregoing; (ii) registered trademarks, service marks or trade names, applications to register trademarks, service marks or trade names, intent-to-use applications, or other registrations or applications related to trademarks, service marks or trade names; (iii) registered copyrights and applications for copyright registration; (iv) any mask work registrations and applications to register mask works; (v) Uniform Resource Locators, World Wide Web site addresses and domain names and (vi) any other Seller Intellectual Property that is the subject of an application, certificate, filing, registration or other document issued by, filed with, or recorded by, any state, government or other public legal authority.

"Seller Hardware" means Hardware included in the Acquired Assets.

"Seller's Intellectual Property" means Intellectual Property of Seller that constitutes an Acquired Asset.

"Seller's Products" means (i) those products of Seller acquired by Seller pursuant to the merger of Atari Corporation, a Nevada corporation, with and into Seller on July 30, 1996, and any other products of Seller thereafter derived therefrom, including products relating to or associated with the trademarks set forth in SCHEDULE 1 (including video and computer games, games for handheld devices, consoles, Internet play, all other games for play on any platform whatsoever (subject to the License Agreements), and merchandise bearing any Intellectual Property relating to or associated with the foregoing, whether now offered for sale or license by Seller or discontinued) and (ii) all of Seller's products that are listed on SCHEDULE 3.

I. SALE AND PURCHASE; ASSUMPTION OF LIABILITIES; PURCHASE PRICE; CLOSING.

A. SALE AND PURCHASE OF THE ACQUIRED ASSETS. At the Closing (as defined below), on the terms and subject to the conditions of this Agreement, Seller shall sell and Buyer shall purchase all of the Acquired Assets for the sum of $5 million to be paid at the Closing by wire transfer to an account designated by Seller.

A. ASSUMPTION OF LIABILITIES. In addition, at the Closing, on the terms and subject to the conditions of this Agreement, Buyer agrees to assume and become responsible for all of the Assumed Liabilities at the Closing. Buyer shall not assume or have any responsibility, however, with respect to any other obligation or liability of Seller that is not an Assumed Liability. Without limiting the foregoing, Buyer shall not assume or be responsible for any liabilities relating to events arising or occurring prior to the Closing, regardless of when payable, and all such liabilities shall be for the account of Seller.

A. CLOSING; CLOSING DELIVERABLES. The closing shall occur in the offices of Wilson Sonsini Goodrich & Rosati, 650 Page Mill Road, Palo Alto, California 94304 upon the execution and delivery of this Agreement by the parties hereto ("Closing"). At the Closing the parties will deliver the following documents, and such additional documents as the parties may agree to transfer ownership of the Acquired Assets to Buyer (which shall be in form satisfactory to both parties) :

1. Seller shall deliver:

(A) A bill of sale for the Acquired Assets.

(B) Global trademark assignments.

(C) Country-specific trademark assignments.

(D) Patent assignments in recordable form.

(E) Assignment of the License Agreements.

(F) Copyright assignment.

(G) Global powers of attorney respecting trademarks.

(H) Country-specific powers of attorney respecting trademarks.

(I) Assignment of Internet domain name.

(J) Disclosure Schedule (as defined below).

1. Buyer shall deliver:
(A) The purchase price by wire transfer.

(B) An instrument of assumption of the Assumed
Liabilities.

A. ASSIGNMENT OF CONTRACTS AND RIGHTS. Anything in this Agreement
to the contrary notwithstanding, neither this Agreement nor the consummation
of
the transactions contemplated hereby shall constitute an assignment, or an
agreement to assign, any Acquired Asset or any claim or right or any benefit
arising thereunder or resulting therefrom (a "Consent-Required Asset") if an
attempted assignment of such Consent-Required Asset, without consent of one or
more third parties, would constitute a breach or other contravention thereof
or
would in any way adversely affect the rights of Buyer or Seller thereunder;
PROVIDED, HOWEVER, that once all such consents are obtained, this Agreement
shall automatically effect an immediate assignment of such Consent-Required
Asset without further action by either party hereto. Buyer and Seller will
use
their commercially reasonable efforts (which shall not be deemed to require
any
payment of money or other value by Seller or Buyer) to obtain the consent of
the
other parties to any such Consent-Required Asset for the assignment thereof to
Buyer as Buyer may reasonably request. If such consent is not obtained, or if
an attempted assignment thereof would be ineffective or would adversely affect
the rights of Seller thereunder so that Buyer would not in fact receive all
such
rights, Seller and Buyer will cooperate in a mutually agreeable arrangement
under which Buyer would obtain the benefits and assume the obligations
thereunder in accordance with this Agreement, including sub-contracting or
sub-licensing to Buyer, or under which Seller would enforce for the benefit of
Buyer, with Buyer assuming Seller's obligations, any and all rights of Seller
against a third party thereto. Seller will promptly pay or assign to Buyer
when
received all monies received by Seller with respect to any Consent-Required
Asset and any claim or right or any benefit arising thereunder, except to the
extent the same

represents an Excluded Asset. Nothing in this Section 2(d) shall be construed
to diminish the representations, warranties and covenants of Seller respecting
such consents.

I. REPRESENTATIONS AND WARRANTIES OF SELLER. Seller represents and
warrants to Buyer that the statements contained in this Section 3 are correct
and complete as of the Closing, except as set forth in the disclosure schedule
separately delivered by Seller to Buyer with this Agreement, which schedule
shall be initialed for identification by the parties (the "Disclosure
Schedule"). Except as expressly set forth in this Agreement and the
Disclosure
Schedule, Seller hereby expressly disclaims any and all other warranties of
any
kind or nature, whether express, implied or statutory, relating to the
Acquired

Assets, including the implied warranties of title, non-infringement, merchantability and fitness for a particular purpose. Buyer acknowledges that the Seller Hardware is transferred "as is" and that, notwithstanding anything to the contrary in this Agreement and the Disclosure Schedule, Seller makes no representation or warranty of any kind with respect to the Seller Hardware.

A. ORGANIZATION OF SELLER. Seller is a corporation duly organized, validly existing, and in good standing under the laws of the State of Delaware.

A. AUTHORIZATION OF TRANSACTION. Seller has full corporate power and authority to execute and deliver this Agreement and to perform its obligations hereunder. Without limiting the generality of the foregoing, Seller has taken all corporate and other action required for the execution, delivery and performance of this Agreement by Seller, including the sale of the Acquired Assets as provided herein. This Agreement constitutes the valid and legally binding obligation of Seller, enforceable in accordance with its terms. The persons who have executed this Agreement on behalf of Seller have been duly authorized to do so.

A. NONCONTRAVENTION. Neither the execution and the delivery of this Agreement, nor the consummation of the transactions contemplated hereby, shall (i) violate any statute, regulation, rule, judgment, order, decree, stipulation, injunction, charge, or other restriction of any government, governmental agency, or court to which Seller is subject or any provision of the charter or bylaws of Seller or (ii) conflict with, result in a breach of, constitute a default under, result in the acceleration of, create in any party the right to accelerate, terminate, modify, or cancel, or require a notice under any contract, lease, sublease, license, sublicense, franchise, permit, indenture, agreement or mortgage for borrowed money, instrument of indebtedness, security interest, or other arrangement to which Seller is a party or by which it is bound or to which any of its assets is subject, except where the violations, conflicts, breaches, defaults, accelerations, terminations, modifications, cancellations or failures to give notice, individually or in the aggregate, would not have a material adverse effect on the Acquired Assets, the Assumed Liabilities or the ability of the parties to consummate the transactions contemplated by this Agreement (a "Material Adverse Effect"). Seller need not give any notice to, make any filing

with, or obtain any authorization, consent, or approval of any government or governmental agency in order for the parties to consummate the transactions

contemplated by this Agreement, except where the failure to do so, individually
or in the aggregate, would not have a Material Adverse Effect.

A. CONSENTS. No approvals or consents of or assignments by any person (including any federal, state or local governmental or administrative authorities) are necessary in connection with the execution, delivery or performance of this Agreement.

A. TITLE TO THE ACQUIRED ASSETS. Seller has good and marketable title, free and clear of all Liens, (i) to the Acquired Assets identified on SCHEDULE 1 (other than copyrights that are not identified on SCHEDULE 4), SCHEDULE 3 and SCHEDULE 4 and (ii) to its Knowledge, to all other Acquired Assets. At the Closing, Buyer shall obtain good and marketable title, free and
clear of all Liens (i) to the Acquired Assets identified on SCHEDULE 1 (other than copyrights that are not identified on SCHEDULE 4), SCHEDULE 3 and SCHEDULE
4 and (ii) to its Knowledge, to all other Acquired Assets.

A. MATERIAL CONTRACTS. True, correct and complete copies of the License Agreements have been delivered to Buyer. Seller has performed in all material respects all obligations required to be performed by Seller under the License Agreements. To the Knowledge of Seller, each of the other parties to the License Agreements has performed in all material respects all the obligations required to be performed by them thereunder to date. Each License Agreement (i) is valid, binding and enforceable in accordance with its terms, (ii) is in full force and effect with no default or dispute existing or, to the
Knowledge of Seller, threatened with respect thereto, and (iii) shall not be terminated or otherwise affected by the execution and delivery of this Agreement
or the consummation of the transactions contemplated hereby. No consent of any
third party is required for the assignment of any License Agreement to Buyer. Seller has provided Buyer with a complete and accurate list of payments paid to
Seller by each licensee under the License Agreements, indicating the licensee and the month paid, from June 30, 1996 to present. Seller has not received any
advanced payments (including prepayments of royalties, or other payments by reason of which a licensee is entitled to reduce its current or future royalty or payment obligations) under the License Agreements which have not been earned
by Seller.

A. INTELLECTUAL PROPERTY.

1. To the Knowledge of Seller, SCHEDULE 1 contains a list of
all trademarks and service marks and applications therefor included in the
Acquired Assets that have not lapsed and that are, except as qualified
therein,
Registered Intellectual Property (the "Registered Marks"), all patents and
applications therefor that are included in the Acquired Assets that are
Registered Intellectual Property (the "Registered Patents"), and United States
copyrights included in the Acquired Assets, certain of which are Registered
Intellectual Property. SCHEDULE 3 contains certain game titles that are
included in the Acquired Assets. To the Knowledge of Seller, (A) the
description of the Registered Marks on SCHEDULE 1 contains, to the extent set
forth and

except as qualified therein, the true and accurate date of registration,
registration number, registered owner and the class of the Registered Marks,
(B) the description of the Registered Patents on SCHEDULE 1 contains the true
and accurate patent number and file date of the Registered Patents, and (C)
the
description of the United States registered copyrights on SCHEDULE 1 included
in
the Acquired Assets that are Registered Intellectual Property contains the
number of such copyright registration.

1. Since July 30, 1996, to the extent that any Seller's
Intellectual Property has been developed by any Person other than Seller for
which Seller has, directly or indirectly, paid, Seller has a written agreement
with such Person with respect thereto and thereby has obtained ownership of,
and
recordable title to, and is the exclusive owner of, all developed Seller's
Intellectual Property by operation of law or by valid assignment.

1. Except as set forth in any License Agreement, Seller has
not
transferred ownership of or granted any license of or right to use or
authorized
the retention of any rights to use any Seller's Intellectual Property to any
other Person.

1. The Seller's Intellectual Property constitutes all
Intellectual Property used in and/or necessary to the conduct of Seller's
Atari
division business as currently being conducted by Seller.

1. To the Knowledge of Seller, neither Seller's Products
included in the Acquired Assets nor the use of Seller's Intellectual Property,
(A) infringes upon or misappropriates the Intellectual Property of any Person,
(B) violates the rights of any Person (including rights to privacy or
publicity), or (C) constitutes unfair competition or trade practices under the
laws of any jurisdiction. Seller has received no notice from any Person
claiming that Seller's Products included in the Acquired Assets nor the use of
Seller's Intellectual Property infringes upon or misappropriates the
Intellectual Property of any Person or constitutes unfair competition or trade
practices under the laws of any jurisdiction (nor, to the Knowledge of Seller,

is there any basis therefor).

1. There are no contracts, licenses or agreements between
Seller and any other Person with respect to Seller's Intellectual Property
under
which there is, to the Knowledge of Seller, any dispute or any threatened
dispute regarding the scope of such agreement, or performance under such
agreement including with respect to any payments to be made or received by
Seller thereunder.

1. To the Knowledge of Seller, no Person is infringing or
misappropriating any Key Mark, other than such infringements or
misappropriations that, individually or in the aggregate, would not have a
Material Adverse Effect on such Key Mark.

1. Seller and, to the Knowledge of Seller, each prior owner
of
the Seller's Intellectual Property have taken whatever reasonable steps that
are
required to protect rights in confidential information and trade secrets of
such
Person and its successors.

1. None of the Seller's Intellectual Property is subject to
any
proceeding or outstanding decree, order, judgment, agreement or stipulation
that
restricts in any manner the use, transfer or licensing thereof by Seller or
may
affect the validity, use or enforceability of such Seller's Intellectual
Property.

1. Seller is not required to make or accrue any royalty
payment
to any third party in connection with the sale, distribution, license,
transfer
or other disposition or exploitation of any of the Acquired Assets.

1. Seller has not developed any new video game software since
July 30, 1996.

1. Seller owns no Intellectual Property not included in the
Acquired Assets that is directly or indirectly competitive with the Seller's
Intellectual Property.

1. (A) Alan Helbush is the Administrative Contact listed in
the domain name record on file with Network Solutions, Inc./InterNIC
Registration Services, and (B) Seller controls the domain name "ATARI.COM".

1. None of the Intellectual Property associated with the
Seller's Products, including the Intellectual Property identified on SCHEDULE
1,
or remedies past and future against infringements thereof and rights to

protection of interest therein is an asset specified in clause (g) of the definition of "Excluded Assets" set forth in Section 1.

A. SUFFICIENCY OF ASSETS. The Acquired Assets include all assets, properties and rights necessary for compliance by Buyer with all obligations relating to the Assumed Liabilities.

A. LITIGATION. There is no claim, dispute, action, proceeding (including arbitration), suit or appeal, or investigation, at law or in equity,
pending (other than those, if any, with respect to which service of process or similar notice has not yet been made and which are not within the Knowledge of Seller) or, to the Knowledge of Seller, threatened against Seller or involving any of the assets or properties of Seller before any court, agency, authority, arbitration panel or other tribunal that would have a Material Adverse Effect.

There is no outstanding order, writ, injunction or decree of any court, agency,
authority, arbitration panel or other tribunal, and Seller is not in default with respect to any notice, order, writ, injunction, or decree, in each case relating to, or affecting the Acquired Assets, the Assumed Liabilities or the Seller's Products.

A. UNDERLYING DOCUMENTS. Copies of all documents listed or described in the Disclosure Schedule and the Schedules hereto have been furnished or made available to Buyer. All such documents are true, correct and
complete copies, and there are no amendments or modifications thereto.

A. BROKERS' FEES. Seller has no liability or obligation to pay any
fees or commissions to any broker, finder, or agent with respect to the transactions contemplated by this Agreement for which Buyer or its affiliates could become liable or obligated.

A. COMPLIANCE WITH BULK SALES LAWS. The sale, transfer and assignment by Seller to Buyer hereunder and the consummation of the other transactions contemplated hereby do not constitute a "bulk sale" by Seller, and
it is not necessary under the laws of any jurisdiction that Seller comply with the bulk sales laws of such jurisdiction.

A. DISCLOSURE. Neither this Agreement nor any of the Schedules nor,
to the Knowledge of Seller, any other documents delivered by Seller in connection with this Agreement contains any untrue statement of a material fact
or omits a material fact necessary to make the statements contained herein or therein, in light of the circumstances in which they were made, not misleading,
and, to the Knowledge of Seller, there is no fact that has not been disclosed to

Buyer that materially affects adversely or could reasonably be anticipated to materially affect adversely the Acquired Assets, or the operation of the Acquired Assets by Buyer as currently conducted by Seller.

I. REPRESENTATIONS AND WARRANTIES OF BUYER. Buyer represents and warrants to Seller that the statements contained in this Section 4 are correct and complete as of the Closing.

A. ORGANIZATION OF BUYER. Buyer is a corporation duly organized, validly existing, and in good standing under the laws of the state of Delaware.

A. AUTHORIZATION OF TRANSACTION. Buyer has full power and authority
(including full corporate power and authority) to execute and deliver this Agreement and to perform its obligations hereunder. This Agreement constitutes
the valid and legally binding obligation of Buyer, enforceable in accordance with its terms. The person who has executed this Agreement on behalf of Buyer has been duly authorized to do so.

A. BROKERS' FEES. Buyer has no liability or obligation to pay any fees or commissions to any broker, finder, or agent with respect to the transactions contemplated by this Agreement for which Seller or its affiliates could become liable or obligated.

A. NONCONTRAVENTION. Neither the execution and delivery of this Agreement by Buyer, nor the consummation by Buyer of the transactions contemplated hereby, will violate (a) any provision of the Certificate of Incorporation or bylaws, as amended, of Buyer or (b) any statute, regulation, rule, judgment, order, decree, stipulation, injunction, charge or other restriction of any government, governmental agency or court to which Buyer is subject.

A. ASSESSMENT OF VALUE. Buyer has been authorized by its ultimate parent entity to make a good faith assessment of the fair market value of the Acquired Assets, has made such assessment, and has determined that the fair market value of the Acquired Assets as of the Closing is less than $15,000,000.

I. POST-CLOSING COVENANTS AND AGREEMENTS.

A. COOPERATION. Each party shall, at all times following the Closing, not take any action inconsistent with the satisfaction of its obligations hereunder and, subject to the following sentence, shall promptly take any further action necessary or desirable to carry out the purposes of this
Agreement (including the execution and delivery of such further instruments and
documents) as the other party may reasonably request. Seller shall take all actions reasonably requested by Buyer, at Buyer's expense (provided that Buyer shall not be obligated for any cost to Seller in respect of the time of Seller's

employees, officers or directors), to enable Buyer to establish a recordable chain of title to the Acquired Assets, including contacting prior owners of items thereof to request appropriate instruments for recordation.

A. DELIVERY. Immediately following the Closing Seller shall deliver to Buyer, and Buyer shall accept and remove from Seller's premises at Buyer's expense within 30 days of the date of Closing, all copies of tangible embodiments of Acquired Assets transferred to Seller (other than software and code, and such other items as the parties may mutually agree, which shall be transferred electronically on or immediately following the Closing and all tangible embodiments of which shall thereafter be destroyed by Seller); PROVIDED, HOWEVER, that (i) any information contained in such materials listed in clause (e) of the definition of "Acquired Assets" that does not relate to the Acquired Assets may be deleted by Seller before such materials are delivered to Buyer and (ii) Seller may make copies of any business or financial documents (other than documents containing Seller Intellectual Property) prior to delivering them to Buyer. Except as provided in Section 5(c), Seller shall cease use of the Seller's Intellectual Property, including the name Atari and the "Fuji" logo relating thereto.

A. SELLER INVENTORY. Seller owns certain unsold inventory of games bearing the Atari and/or Fuji trademark, and certain other Registered Marks and containing other Seller's Intellectual Property (the "Inventory"). Buyer hereby grants to Seller an irrevocable, worldwide, royalty-free license, for a period of one year from the date of the Closing to use the Registered Marks and other applicable Seller's Intellectual

Property relating to such Inventory solely for the purpose of selling the Inventory. Except as set forth in the previous sentence, after the Closing Seller shall have no right to exploit the Seller's Intellectual Property. Without limiting the foregoing, Seller shall not, following the expiration of the one-year license period set forth above, sell any product referred to in clause (e) of the definition of "Excluded Assets" set forth in Section 1. Seller warrants that the Inventory sold pursuant to this Section 5(c) shall be of like kind and quality to that previously sold by Atari Corporation in the ordinary course of its business.

A. NOTICE OF DEVELOPMENTS. Seller shall give prompt written notice to Buyer of any material development that could have a Material Adverse Effect. Each party shall give prompt written notice to the other of any material development affecting the ability of the parties to perform their post-Closing obligations under this Agreement.

A. ENFORCEMENT OF RIGHTS. In connection with the enforcement of its rights of ownership of the Acquired Assets and the enjoyment thereof, Buyer may bring actions in the name of Seller, or cause Seller to join any such action as a party, as reasonably necessary, provided that Buyer shall indemnify Seller with respect thereto.

A. MAINTENANCE OF INTELLECTUAL PROPERTY; DELIVERY OF NOTICES. After the Closing, Seller shall not be responsible for the maintenance or renewal of any registration with respect to the Acquired Assets, such responsibility to belong to Buyer as the owner of the Acquired Assets; PROVIDED, HOWEVER, that Seller shall promptly forward to Seller any and all notices and correspondence which it may receive pertaining to the Acquired Assets; and FURTHER PROVIDED that Seller shall remain responsible for the maintenance and renewal of registration with respect to all of the Consent-Required Assets retained by Seller pursuant to Section 2(d) of this Agreement as a consequence of the failure to obtain a required consent of a third party until such time as the applicable consent is obtained.

A. LITIGATION SUPPORT. In the event and for so long as Seller actively is contesting or defending against any action, suit, proceeding, hearing, investigation, charge, complaint, claim or demand in connection with any fact, situation, circumstance, status, condition, activity, practice, plan, occurrence, event, incident, action, failure to act, or transaction involving the Acquired Assets or the Assumed Liabilities, Buyer will provide access upon prior request and during its regular business hours to the books, records and other items specified in clause (e) of the definition of Acquired Assets set forth in Section 1 as shall be reasonably necessary in connection with the contest or defense, all at the sole cost and expense of Seller and subject to Seller's execution and delivery of Buyer's standard form of confidentiality agreement with respect to such items.

I. INDEMNIFICATION.

A. INDEMNIFICATION AND REIMBURSEMENT OF BUYER'S LOSSES. Seller shall indemnify Buyer and its affiliates, together with their respective officers, directors and employees (each a "Seller's Indemnitee") against Losses (as defined below) as set forth in this Section 6. If a Seller's Indemnitee shall have suffered a Loss by reason of (i) the breach of any of the representations or warranties made by Seller herein, (ii) any matter arising prior to the Closing with respect to the Seller's business, an Acquired Asset or an Assumed Liability, (iii) any liability of Seller that is not an Assumed Liability or (iv) any breach of a covenant of Seller hereunder, Seller's Indemnitee shall be reimbursed for such Loss by Seller as set forth in this Section 6. For purposes hereof, "Loss" shall mean any losses, liabilities, claims, damages and expenses incurred or reasonably expected to be incurred,

including penalties, fines, interest, amounts paid in settlement and reasonable fees and disbursements of counsel, and expenses incurred in connection with any investigation, action, suit or proceeding instituted against an indemnified party. Notwithstanding the foregoing, Seller shall have no obligation to indemnify Seller's Indemnitees for Losses which, cumulatively, total less than $25,000; PROVIDED, HOWEVER, that if cumulative Losses equal or exceed said $25,000, then Seller shall indemnify Seller's Indemnitees for all of such Losses. Liquidated Claims (as defined below) actually paid by Seller under this Section 6 shall be limited to an aggregate of $5 million.

A. INDEMNIFICATION AND REIMBURSEMENT OF SELLER'S LOSSES. Buyer shall indemnify Seller and its affiliates, together with their respective officers, directors and employees (each a "Buyer's Indemnitee") against Losses as set forth in this Section 6. If a Buyer's Indemnitee shall have suffered a Loss by reason of (i) the breach of any of the representations or warranties made by Buyer herein, (ii) any matter arising after the Closing with respect to the Buyer's business, an Acquired Asset or an Assumed Liability, provided such matter is not related to or arising from any breach of a covenant, representation or warranty of Seller or any act or omission by Seller involving wilful misconduct, fraud or bad faith, or (iii) any breach of a covenant of Buyer hereunder, Buyer's Indemnitee shall be reimbursed for such Loss by Buyer as set forth in this Section 6. Notwithstanding the foregoing, Buyer shall have no obligation to indemnify Buyer's Indemnitees for Losses which, cumulatively, total less than $25,000, provided however that if cumulative Losses equal or exceed said $25,000, then Buyer shall indemnify Buyer's Indemnitees for all of such Losses. Liquidated Claims actually paid by Buyer under this Section 6 shall be limited to an aggregate of $5 million.

A. PAYMENT. At such time as the reimbursable amount of a Claim or a Third Party Claim has been determined in accordance with this Section 6 (a "Liquidated Claim"), the indemnifying party shall immediately pay the Person to be indemnified hereunder (an "Indemnitee") the amount of the Liquidated Claim.

No forbearance of an Indemnitee in demanding payment from the indemnifying party shall act as a waiver of any right of an Indemnitee to receive payment from the indemnifying

party, nor shall it relieve the indemnifying party of any obligation to an Indemnitee under this Agreement.

A. NOTICE OF CLAIMS. In the event an Indemnitee has any claim for indemnification under Section 6(a) or Section 6(b) (a "Claim"), it shall give

prompt written notice thereof to the indemnifying party, including in such notice a brief description of the facts upon which such claim is based and the amount thereof.

A. THIRD PARTY CLAIMS.

1. If any third party shall notify an Indemnitee with respect to any matter (a "Third Party Claim") that may give rise to a claim for indemnification against a party hereto (the "Indemnifying Party") under this Section 6, then the Indemnitee shall promptly notify the Indemnifying Party thereof in writing; PROVIDED, HOWEVER, that no delay on the part of the Indemnitee in notifying the Indemnifying Party shall relieve the Indemnifying Party from any obligation hereunder, unless (and then solely to the extent) that the Indemnifying Party is prejudiced.

1. The Indemnifying Party shall have the right to defend the Indemnitee against the Third Party Claim with counsel of the Indemnifying Party's choice reasonably satisfactory to the Indemnitee so long as (A) the Indemnifying Party notifies the Indemnitee within 15 days after the Indemnitee has given notice of the Third Party Claim that the Indemnifying Party will indemnify the Indemnitee as required by (and subject to the limitations of) this Section 6 for Losses arising out of, relating to, in the nature of, or caused by the Third Party Claim; (B) the Indemnifying Party provides the Indemnitee with evidence reasonably acceptable to the Indemnitee that the Indemnifying Party will have the financial resources to defend against the Third Party Claim and fulfill its indemnification obligations hereunder; (C) the Third Party Claim involves only money damages and does not seek an injunction or other equitable relief; (D) settlement of, or an adverse judgment with respect to, the Third Party Claim is not, in the good faith judgment of the Indemnitee, likely to establish a precedential custom or practice materially adverse to the continuing business interest of the Indemnitee; and (E) the Indemnifying Party conducts the defense of the Third Party Claim actively and diligently.

1. So long as the Indemnifying Party is conducting the defense of the Third Party Claim in accordance with Section 6(e)(ii) above, (A) the Indemnitee may retain separate co-counsel at its sole cost and expense and participate in the defense of the Third Party Claim; (B) the Indemnitee shall not consent to the entry of any judgment or enter into any settlement with respect to the Third Party Claim without the prior written consent of the Indemnifying Party (not to be withheld unreasonably); and (C) the Indemnifying Party shall not consent to the entry of any judgment or enter into any settlement with respect to the Third Party Claim without the prior written consent of the Indemnitee (not to be withheld unreasonably).

1. In the event any of the conditions in Section 6(e)(ii) above

is or becomes unsatisfied, however, (A) the Indemnitee may defend against, and consent to the entry of any judgment or enter into any settlement with respect to, the Third Party claim in any manner it reasonably may deem appropriate (and
the Indemnitee need not consult with or obtain any consent from, any Indemnifying Party in connection therewith); (B) the Indemnifying Party shall reimburse the Indemnitee promptly and periodically for the reasonable costs of defending against the Third Party Claim (including attorneys' fees and expenses), and (C) the Indemnifying Party shall remain responsible for any Losses the Indemnitee may suffer resulting from, arising out of, relating to, in
the nature of, or caused by the Third Party Claim to the fullest extent provided
in this Section 6.

A. DISPUTED CLAIMS. If Seller objects to any Claim or Third Party Claim, it shall give written notice of such objection and brief statement of the
grounds of such objection to Indemnitee within 20 business days after notice is
received. If no such objection is given, such Claim or Third Party Claim, as the case may be, shall be a Liquidated Claim. If such objection is made, Indemnitee and Seller shall meet and use their best efforts to settle the dispute in writing that when resolved shall be a Liquidated Claim.

A. SURVIVAL. The provisions of this Section 6 shall survive the Closing. Notwithstanding anything to the contrary in this Agreement, no Claim or Third Party Claim may be asserted by a Seller's Indemnitee under this Section
6: (i) with respect to Losses arising in connection with the obligation to pay
taxes, following the date of the expiration of the applicable statute of limitations for such obligation; (ii) with respect to a Loss arising out of or in connection with a License Agreement, following the termination of such License Agreement in accordance with its terms; and (iii) with respect to all other Losses, following August 31, 2000. No Claim or Third Party Claim may be asserted by a Buyer's Indemnitee under this Section 6, other than Losses arising
with respect to the Assumed Liabilities, following August 31, 2000. Notwithstanding the preceding sentence, an Indemnitee may assert a Claim or Third Party Claim under this Section 6 with respect to Losses that are the result of fraud or wilful misconduct by the Indemnifying Party at any time within the applicable statute of limitations for such claim.

A. The right of each party hereto to assert Claims and receive indemnification payments pursuant to this Section 6 shall be the sole and exclusive right and remedy exercisable by such party with respect to any breach
by the other party hereto of any representation or warranty or failure to perform any covenant required to be performed by such other party; PROVIDED, HOWEVER, that the above shall not prevent a party hereto from seeking specific

performance of a covenant which another party hereto has failed to perform under
this Agreement.

I. MISCELLANEOUS.

A. NO THIRD PARTY BENEFICIARIES. Except as otherwise specified herein, this Agreement shall not confer any rights or remedies upon any person other than the parties and their respective successors and permitted assigns.

A. ENTIRE AGREEMENT. This Agreement (including the documents referred to herein) constitutes the entire agreement between the parties and supersedes any prior understandings, agreements, or representations by or between the parties, written or oral, that may have related in any way to the subject matter hereof.

A. SUCCESSION AND ASSIGNMENT. This Agreement shall be binding upon
and inure to the benefit of the parties named herein and their respective successors and permitted assigns. Seller shall not assign any of its rights, interests or obligations hereunder without the prior written consent of Buyer.

Buyer may assign its right, interests and obligations hereunder to any Person provided that such permitted assignee agrees to be bound by the terms hereof and
to assume all obligations of Buyer hereunder.

A. COUNTERPARTS. This Agreement may be executed in one or more counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

A. HEADINGS. The section headings contained in this Agreement are inserted for convenience only and shall not affect in any way the meaning or interpretation of this Agreement.

A. NOTICES. All notices, requests, demands, claims, and other communications hereunder in writing. Any notice, request, demand, claim, or other communication hereunder shall be deemed duly given five business days after mailing if sent by registered or certified mail, return receipt requested,
postage prepaid and addressed to the intended recipient as set forth below:

If to Seller:

JTS Corporation
1661 Baypointe Parkway
San Jose, California 95134
Attention: President

Copy to:

Cooley Godward LLP
5 Palo Alto Square
Palo Alto, California 94306

Attention: Andrei M. Manoliu, Esq.

If to Buyer:

HIAC XI, Corp.
1027 Newport Avenue
Pawtucket, Rhode Island 02862
Attention: President

Copy to:

Hasbro, Inc.
1027 Newport Avenue
Pawtucket, Rhode Island, 02862
Attention: General Counsel

Copy to:

Wilson Sonsini Goodrich & Rosati
650 Page Mill Road
Palo Alto, California 94304
Attention: Eric W. Wright, Esq.

Any party may give any notice, request, demand, claim, or other communication hereunder using any other means (including personal delivery, expedited courier, messenger service, facsimile, telex, ordinary mail, or electronic mail), but no such notice, request, demand, claim, or other communication shall be deemed to have been duly given unless and until it is received by the person for whom it is intended. Any party may change the address to which notices, requests, demands, claims, and other communications hereunder are to be delivered by giving the other party notice in the manner herein set forth.

A. GOVERNING LAW. This Agreement shall be governed by and construed in accordance with the laws of the State of California as such laws are applied to agreements entered into and to be performed entirely within California by California residents.

A. AMENDMENTS AND WAIVERS. No amendment of any provision of this Agreement shall be valid unless the same shall be in writing and signed by Buyer and Seller.

A. EXPENSES. Each of Buyer and Seller shall bear its own costs and expenses (including legal fees and expenses) incurred in connection with the negotiation and preparation of this Agreement and the transactions contemplated hereby. Buyer shall, pursuant to Section 5(a) of this Agreement, bear all costs

and expenses of the recordation of chain of title to the Acquired Assets, including preparation and recordation of appropriate assignments of the Acquired
Assets.

A. CONSTRUCTION. The language used in this Agreement shall be deemed to be the language chosen by the parties to express their mutual intent,
and no rule of strict construction shall be applied against any party. Any reference to any federal, state, local, or foreign statute or law shall be deemed also to refer to all rules and regulations promulgated thereunder, unless
the context requires otherwise. Except as otherwise specified, references in this Agreement to Sections and Schedules are to Sections of, and Schedules attached to, this Agreement. Except where the context clearly requires to the contrary, "including" shall mean "including, without limitation".

A. SCHEDULES. The Schedules identified in this Agreement are incorporated herein by reference and made a part hereof.

A. TRANSFER TAXES. Any and all sales, use or other transfer taxes arising from the transactions contemplated by this Agreement shall be paid by Seller.

A. CONFIDENTIALITY OF INFORMATION. All information given to a party
by the other party in connection with this Agreement ("Confidential Information") shall be used only for purposes related to the consummation of the
transactions contemplated herein, and shall be disclosed to the receiving party's employees and representatives only on a "need to know" basis in connection with such purposes. If the Closing does not occur for any reason, each party shall maintain in confidence all Confidential Information of the other party, shall return to the disclosing party all tangible embodiments (and
all copies) of such Confidential Information and shall not use such Confidential
Information for any purpose; PROVIDED, HOWEVER, that the forgoing restrictions shall not apply to: (i) information that is or becomes a matter of public knowledge through no act or failure to act of the receiving party, its representatives or employees, (ii) information that becomes available to the receiving party from a source not under an obligation of confidentiality to the
disclosing party, or (iii) information that was known to receiving party prior to its disclosure to the receiving party by the disclosing party.

IN WITNESS WHEREOF, the parties have executed this Asset Purchase Agreement
on the date first above written.

I wonder what plans Hasbro has for atari. Theres' $$ in the arcade
division and home console games division. Hehe MAybe we'll see a new
atari console; then again maybe not hehehe.

Now, the question is, will Hasbro Interactive do anything worthwhile with
Atari. I did notice that the computers were specifically listed as being
part of the deal. It makes me curious that they specifically mentioned
the computers (8-bit, ST, Falcon, and TOS), so does that mean there is
some plan to use this for something? I mean, $5 million for Atari is a
good chunk of money. I wonder who we can get to tell more of this deal.
Sure enough $5 mil is not worth it for Atari's management......

Maybe Hasbro has a game system in the works and wants to use the Atari
label.......

I'm sure in the coming months rumors will start to appear everywhere!

My 1050 Duplicator drive runs at 290-291 RPM and it can read all my disks.
My Trak drive runs at around 281 RPM and it's even worse.
Is it just my drive speed or should my drives not be having any trouble?

And how do I adjust the drive speed?

I really can't say one way or another.But you should always use Y-MODEM or F-MODEM simply because they're faster.I'll have to do some tests with BobTerm to verify it's X-MODEM behaviour.

>any file, Basic or Binary, which wouldn't run just fine even
>with the added bytes, with the exception of if someone was
>using Sparta-Dos. The Binary files contain the length of
>each segment within the file, so any program which is using
>a good loader, shouldn't have any problem, and a simple
>Basic Load command will load any basic files too.

Yeh but then it tries to proccess all the control-Zs at the end as a header,causeing $1A to be loaded at $1A1A.This may or may not over-write part of the programme depending on the initial load address and whether it re-locates it-self in between segments (INIT) or after it's done loading (RUN) (c.f.SuperArc).
And I assume that the EOF error in the middle of proccessing the last few control-Zs would cause some (all?) DOSes to abort executing the RUN address.

And I used to download a lot of files back in the old days via (BobTerm's) X-MODEM before I knew what idiodicy it was and had several programmes malfunction.(remember that it was never designed for UNIX-style DOSes in mind)
And I remember when I first ran TurboBASIC that it chewed up my one of my disks' (DOS 2.5 1050 style) and I didn't have DISKFIX back then.

Having said all that,downloading ARCs should be no problem.
(ALF seems to be just ARC with a new compression algorithm)
You'll get errors at the end of un-arcing the file when it encounters the garbage,but by then all the files will have been extracted.

>5 or My Dos, SpartaDOS, it didn't matter, there was a conversion

Actually DOS 2.5 comes with a programme just for that purpose.
As well as a DISKFIX and SETUP (?) programme.

>utility I can't remember the name something like d3conv2 or
>something that would convert files back but it was a nuisance and

>was having no problems selling 180K drives it beyond me, it was a
>waste of time and money.

Technicaly,it is double density.It's just a smaller sector-size.You just need
to add 128 bytes of RAM and a new ROM OS for the drive and you have Percom
SSDD compatibility.

Well just look at how little Atari did to support the 1050's "enhanced" dual
density.They made a dirty little hack that STILL didn't let you use the whole
disk.(you lose 1875 bytes)
Where as MYDOS both maintained compatibility with DOS 2 and at the same
time made it so that any future disk drives would be usable since it supports
virtualy infinite sectors.The point is that 256-byte sectors means 256-byte
drive and file buffers.Meaning less memory meaning software not running.
(some software leaves very little room for DOS)
Look at the trouble they went through to make sure that that one extra disk
buffer for the RAM disk would not increase the ammount of RAM it used.
DOS 2.5 with 6 drive/file buffers,usually set up for 3 files and 3 disk drives
(only two disk drives if you don't load the RAMdisk handler,which automaticly
adds on a drive buffer) uses as much RAM as DOS 2.0,which has 2 drive and 3
file buffers by default.

>Synchromesh

The SDX manual says that the GT supports UltraSpeed but that it's buggy and
hence the need for INDUS.SYS.This is most probably a bald faced distortion and
the INDUS.SYS driver is just altering the GT for use with SDX.
(but only with SDX.The driver doesn't allow other DOSes to do UltraSpeed)

>Xf551, (my personal fav 8bit drive, so I am horribly biased)
>TRUE DS/DD (ie 360k per disk, without flipping), sleek XE-grey

>drives for BBS backups (in the olden days)
>I would like to own both actually..

I'm pretty sure that the XF551 doesn't use UltraSpeed.I know it has it's own
special protocol that BW-DOS and SDX will use.
(but SDX modifies the XF551 via INDUS.SYS in some unknown way)

And it doesn't report "sector not found" errors corectly so the copy
protection for some games will fail and the game won't play.
And you can't format the back side of a disk for single-sided operation.
Having a spare 810 or 1050 (preferable) to play games and format disks
aleviates these problems.

>Anyone know?

You need a total of 256 bytes of RAM to buffer a single sector because the
Atari can't take the information as fast as the drive gets it from the disk.
So a 128-byte RAM uprgade at least.I prefer the track-buffer idea since it
means that you don't have to use a special format for high-speed.

>>Atari did use multi processors in addition to the main
>>CPU such as the Antic chip.

Acording to the Atari hardware manual the Atari is slowed down by 36% in the default text mode (40x24).This would leave you at 1.05mhz.
Text mode takes up almost 9k,960 bytes for video RAM and 1k for the character set but it gets read over-and-over again so it amounts to reading 8k per jiffy.
Graphics mode takes up 7680 (using 192 scan-lines) bytes per jiffy so it would be faster.But software is free to tailor the number of scan-lines and hence gain speed.And there's also a narrow playfield (128 pixels) and wide playfield (192 pixels) in adition to the normal playfield (160 pixels) mode.

I hardly relate Windows to a boot menu.There are much better menu programmes
for MS-DOS.Plus in MS-DOS you don't have to pre-set the graphics mode like you
do in Windows and lots of ST software.And you don't have to worry about icons
getting "blacked out" by setting the number of colours too high.
And Windows has several configuration files that have to maintained.
(the MS-DOS multi-tasking vector is by default de-activated so programmes like
PRINT won't function while Windows is running without DIRECTLY editing the
configuration files)
And relative pathnames don't work so if you ever have to run Windows from a
different drive (ala ZIP drives) then you have to edit every single icon.
Not to mention the incredibly slow graphics interface that was obviously only
meant to show static images.And many programmes using all ALT-key commands.

Nope.I never saw Windows as ever being easy.Like that menu that comes with
SpartaDOS 1.1.I just never minded typing out measly 8 character filenames.
(I didn't use directory-name extentions back then)
Plus I've had NDOS (4DOS) for years and it has filename completion.Otherwise
I'd just make up a batch file menu to run games.
(I did that years ago when I first got a IBM but then realized that I just
wasn't that lazy)

Plus boot menus are need for some Atari games that over-write DOS.

I was talking to a Electronics Boutique worker about Wolfenstein on the 3DO and
IBM and he said he that with the IBM you have to get it set up and working
where as the 3DO version just ran.
Now has anyone really had to do any configuration to get Wolfenstein 3D to

work?
It's all automatic for me.IT sees your BLASTER variable and knows what sound card you have.runs your XMS & EMS interupts ("servers") and asks MS-DOS about how much memory you have.Runs the video BIOS ROM interupt to set up 320x200x256 graphics.I just couldn't see his point.

Well who couldn't set a VCR clock.On the old ones it was just like setting a watch.The new ones are more fancy,with are on-screen instructions.
Either way it's simple.

>most colors i ever used was 16 in graphics 11

That's not quite corect.You get 15 colours as well as a "Black & White"
null-colour.
With 8 different brightnesses that's a total of 128 combinations.

But GR.9 gives you one colour (or none if colour "0" is selected) and 16 (!)
brightnesses.Using interupt-driven machine language you can change the colour
as fast as the TV/monitor can draw the image and hence get 256 different
combinations.
(but it's been said that some of the combinations are redundant)

The machine language is pretty simplistic and anyone could do it with A65.
(available on the Atari archive at umich;check the FAQ)

The 850 supports it,it's just not automatic.For some reason term programmes
aren't setting up the 850 like they should.
(no foresight!)

You can also just run Kermit-65,type "connect",press OPTION and then "c" to get
out of term mode,and then quit and the 850 will be set-up corectly.

I thought that having the video (DMA) circutry doing RAM re-fresh was pretty standard.At least for computers of the 80's.
(I know that the Apple's video circutry does re-fresh)
I assume that computers with seperate video RAM (like the TI-99/4) have some other way.The IBM PC uses DMA channel #0 to do re-fresh.But the later IBMs (XT?) have dedicated circutry.

I knew about ANTIC doing re-fresh (not to be confused with video re-fresh) long ago from my Atari hardware manual.Came with the OS manual and source code.
It'd be nice if these could be archived some where.

$5 million is actually a very small sum of money for the name alone, if the
right people can act upon the right memories of the right consumers. That
the computer lines are included is either complementary or central to their
plans; that's what we'll be watching for. Don't necessarily expect anything
right off the bat. Many wise investors, seeing an opportunity, act well in
advance of any plans, buying when others are fleeing... a la Warren Buffet
buying 20% of worldwide above-ground silver reserves recently. He's just
waiting... he can afford to.

I thought I recently heard that Hasbro was laying off several hundred
employees and closing a plant. I wonder if the Atari purchase has anything
to do with this. Could be a refocusing of their management's vision.
Hmmm... an Atari web-box? No reason you can't sell one today for $99.

Source record: 65010

I am looking for the following carts for Atari 8 bit computers:

Fort Apocalypse (Synapse)
Boulder Dash (First Star)
Crystal Castles (Atari)
Tutankham (Parker Bros.)
Gyruss (Parker Bros.)
Pastfinder (Activision)
Rally Speedway (Adventure Intl)
Omega Race (CBS)
Satan's Hollow (CBS)
Solar Fox (CBS)
Tapper (Sega)
Up 'N Down (Sega)
Jawbreaker (Sierra)
BC's Quest For Tires (Sierra)
Sammy Lightfoot (Sierra)
Fast Eddie (Sirius)
The Pharoah's Curse (Synapse)
Protector II (Synapse)
Orc Attack (Thorn EMI)
Bounty Bob Strikes Back (Big Five)

If anyone has any one of these carts for sale, please email me with your asking price. I realize that this is a pretty long list, but I would be happy to get just one of these carts. Thank you.

Considering Hasbro's success with the Frogger remake (as lousy
as it was, it did sell), I bet Hasbro is just chomping at the bit to
re-release some of Atari's back catalog in anticipation of similar
success. Somehow I doubt Hasbro will do anything with the hardware, but
who knows. Maybe they will incorporate it into some kind of toy, like
a Pico-style device.

2574. Need help booting disk-based games

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-11 00:00:00 UTC
From: Game Lord <gamelord@ptdprolog.net>
Message-ID: <Pine.GSO.3.95.980311183145.28242D-100000@home.ptd.net>
Source record: 65012

Well to start off, I was given some Atari equipment this past Saturday. I already had a 130XE, which is how I played my carts, but I did not have a disk drive. I was given the 810 drive. Now, since I am an vid C64 user and freak, I am not familaiar with the operation of loading games fro disk.(To get it out of the way, I do not believe in any Atari 8-bit VS. C64 debate. Really is kind of lame, but if you are having fun...) These disks are, of course, copies of many old games I believe were available for only Atari. My question is, using my 130 XE and 810 drive, how do I load the directory and/or particular game? I was told by another dude I spoke with on here, that the disks must have DOS 'installed' on themselves. To keep it short, any response from anyone explaining to me in detail or if you can direct me to an FAQ that explains this, I certainly would appreciate it. I look forward to hearing from any of you dudez, and I will take it upon myself to visit this group more often. I always wanted a nice XL/XE setup anyway to accompany my 64. Now, I can play the faves I haven't played in over a decade. Thanx in advance for your time and consideration. Take care.

>Sure enough $5 mil is not worth it for Atari's management......

5 million is chump change for Hasbro, especially after just having
purchased Tiger Electronics last month (Feb 9th) for 335 million.
Which leads me to....

>Maybe Hasbro has a game system in the works and wants to use the Atari
>label.......

My conspiratorial mind is highly curious if there might end up being
some form of game.com / Atari collaboration now. Perhaps use the Lynx
technology to give the Com a much-needed shot in the arm?

>I'm sure in the coming months rumors will start to appear everywhere!

Why wait months when we can start now? :)

Hey, that sounds exactly like the program I've written that I've
talked about several times here in the past month or two.

Mine is distributed as C source, and is known to work with Unix, but
hopefully it won't be a big deal for someone to compile it for DOS.

Sucks! Received this message today from Mouser. They were the last reliable place I had been able to find the 64k x 4 chips for the 600xl 64k mod. Anyone know of any other outfit that carries them or does anybody have a couple they would sell. Mouser had them for $2.40 and there's no point in paying $10 a piece for them, so anyone trying to gouge has no point in responding to this. Mouser is cool because there is no minimum order and they charge you REAL shipping costs... you can order just a couple of chips if you like.

Chris
(to reply to me remove the SPAM from each of the fields of my address, otherwise post it here!)

Not necessarily, the agreement merely spells out that Hasbro gets all
the
assets of Atari, from video games to computers. It doesn't mean Hasbro
is
going to release computers, just says they now own all the
rights/patents/etc.
to the computer line.

Essentially, JTS is transferring everything under the Atari label to
Hasbro.

2580. SIO2PC built into Atari case?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-11 00:00:00 UTC
From: mile23@usa.net
Message-ID: <mile23-ya02408000R1103981721450001@nntp.ix.netcom.com>
Source record: 65018

I've found a few references in DejaNews to building an SIO2PC interface inside the case of an Atari. I haven't been able to find any information about how to do this, tho. Is it more complicated than just soldering the appropriate wires into the SIO port's connector? Where does the IC get its power? etc...

Any help appreciated.

I assume this was while the 1080 was connected to an Amiga? If so, one thing to keep in mind that this was an RGB analog connection, and as such, the only real difference was the timing. In a composite connection, you have a different colorburst frequency to deal with, meaning that while a NTSC color composite monitor might be able to handle the timing, and thus display the picture, it would not pick up the expect color information, and therefore the picture would be in black and white.

The XF551 uses a standard "PC-type" 5.25" 360K mechanism (of the same variety as an old XT), which clearly indicates the handling of FM disks is soley a controller problem.

The XF551's controller board would be a good starting point for a new design, as it is fairly simple. The problem is that its controller can only handle standard density media, meaning you could use up to a 720K, 3.5" disk, but not HD media.

Atari does NOT have an arcade division. It's a long story, but the end
result of it all is that Atari Games, the arcade game maker, is now a
division of Williams (maker of Defender, Sinistar, etc...).

As for a new Atari console... I wonder if Hasbro is a Project X
licensee?

re: relays on joystick ports

You could multiplex pins 1 to 4,
resulting in 16 possible outputs. If
you switch in a different resistor of
each relay, and pick the resistors
carefully, you might even read the
resulting resistance through pins 5
and 9. These pins are analog inputs.
Each input would be able to read the
condition of eight relays. But you
need eight different resistors for
each input.

And... if you multiplex this way, you
have to use a flip-flop or you'll
only be able to either have one relay
ON and the rest OFF or vice versa.

Howdy folks

For those looking for ATARI power
supplies:

Jameco is selling two power supplies,
both for use with 115 Volts:

Number 1:

Output 5V, 1 Amp
XL/XE type power plug (7 pin)
400 in stock
Jameco # 116089 Atari # CO70042

Number 2:

Output 5V, 720 mA
12V, 210 mA
5 pin power plug (maybe 1200XL???)

1062 in stock
Jameco # 147467 Atari # PS32

Both cost $9.95 if you buy one to
nine of them, buy more and you save a
dollar. For some reason your not
supposed to buy 24 of these.

CU Mathy Van Nisselroy

PS yes, it surprised too. And the
quantities they have...

Re: SECAM ATARI's

What's the contents of address 53268
(also known as "PAL". Software can
look here to see if a computer is
NTSC or PAL, and maybe even SECAM)?

Let me quote (and translate and
condens) an issue of a European
Electronics magazine:

SECAM stands for "sequentielle a
memoire". This means the color
difference signals are not send
simultanious but one after the other.
Each signal with a sequencial
(screen-) line. The signal of one
line has to be delayed 64
microseconds after which it is
processed together with the signal
from the following line.

Since I don't know much about
television, I don't really understand
all of the above. So please don't
ask ME what it means.

Howdy folks

I sent a message to B&C
ComputerVision concerning the MYDOS
CARTRIDGE they are selling. You'll
see Bruce's reply first, then my
question.

It is brand new just done. I believe
it is 4.x and supports up to 1 meg
RAM disk. We are supplying the
cartridge to the maker and it is the
standard brown Atari 8-bit cartridge
with a simple printed label. We are
not set up to upload pictures yet.

B & C ComputerVisions
Web site: www.myatari.com

Can you tell me more about the MyDOS
cartridge? Like how old is it.
I've heard from Charles Marslett that
he had made a Cartridge version of
MyDOS 3.016. Or actually there were
THREE versions.

Is this the cartridge you are
selling, or is it "brand new"? You
wouldn't happen to have a picture you
could put on you homepage, would ye'?
(or send me :-) if you do so,
please tell me which file I need to
look at/print out the picture.)

BTW I'd be interested if the
cartridge a NEW. (and I know for a
fact that I'm not the only one!)

CU Mathy Van Nisselroy

The cartridge costs $19.95 (ex.
shipping). They recently moved to a

new location and I don't know their
new snail mail address. Their new
EMAIL address is myatari2@juno.com.

Hmm. How about having the "A8 Browser" handly everything like a web browser with little memory. Ie. Have all of the text on screen, but graphics as buttons. You click the button and then graphics gets transferred. (Or did someone already type this.)

As for compression, I heard of something called dpeg, like jpeg offers high levels of compression, but can be decompressed more quickly. The place I heard it was used was in another Atari machine, the Jaguar. Besides that I know nothing about it, sorry. Maybe Atari folks here could make a big change in the rest of the internet community and it would benefit everyone here.

Does know of the source of an html interpreter? If only to extract the text and links.

Bill M.
Probably left things only half-said, but I tried.

Actually I have one of those MIO's with the 80 columns, and it worked when I tried it...

Why not use Bobterm? Way better. Or how about IceT or Flickerterm?
Those are the state of the art in the atari8 world.

>what those values mean, of course).

MYDOS will store the same info in the boot sector as any other DOS. This is
because the OS must use it to locate and load DOS into ram.
Sector 1, byte offset 0-19 hold the useful info. b14=1=DOS;=0=No DOS,
B15 & 16=sector to start of DOS, B18 & B19=DOS load address, B9= #file buffers,
B10=drive bits, and B17=Disp to sector link(effectivly, disk density). The
rest of the stuff is either in DOS(ramdisk config), or Mydos guese, i.e. >720
sectors, or double sided.

2602. Atari 800 0.9.2 Emulator

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-11 00:00:00 UTC
From: thor@math.tu-berlin.de
Message-ID: <thor.889611646@math.tu-berlin.de>
Source record: 65063

Hi folks!

There's now an upgraded and updated version of David's atari 800 emulator
available. For those of you who are interested, it's available at my home
page as .lzh file (.tar.gz available on request). The url is in my signature
below.

The current version compiles fine on SGI and SUN, but the PC and Amiga port
is really outdated and needs a lot of service. Thus, if anybody is interested
in some PC/Amiga programming, lemme know!

Here's the list of changes made to the emulator:

Changes in 0.9.2
----

o Rewrote ANTIC emulation, supports changes of the character set within a
mode line now.

o Added FORMAT and 815 N and O commands in the SIO module.

o Rewrote DLI logic completely.

Changes in 0.9.1
----

o Rewrote Player/Missile logic

o Rewrote priority engine. Works now, with all modes.

o Rewrote vertical & horizontal scrolling logic

o Redesigned color fiddling logic

o Added color artefacting (-artefacts) switch and routines. Still a bit "beta"

o Rewrote "MMU" support, new module mem.c designed.

o Redesigned loading of Os modules and external cartridges

o Debugged 5200 support. Should work now, but still something to do.

o Added almost all extra instructions, with the exception of some messy
ones that depend on the external bus state.

Changes in 0.9.0
----

o Made -private_cmap flag really working (jhs)

o Updated X11 support (jhs)

o debugged PIA support (thor)

o debugged POKEY support (thor)

o GTIA emulation highly updated (thor)

o FIDDLED Antic_2,_3 and _F mode rewritten, resulting in

much cleaner simulation without wrong colors.

o some undocumented player/missle "mixing" priorities are now supported (thor)

o Added simulation of Atari XL CartCtrl (GTIA-3) pin (thor)

o Added better DLI timing (thor)

o Added sprites on top of GTIA modes 0x40 0x80 0xc0 (thor)

o Removed DIRECT_VIDEO support (thor)

o Correct handling of CPU interrupt bit (thor), LucasFilms keyboard parsing
works now.

o Correct (checked!) support of direct (non-SIO) I/O (thor), SIOPatch no
longer needed (though RECOMMENDED for speed).

o Corrected bug in vertical fine scrolling. (thor)

o Correct emulation of a bug in the 6502 ZPage addressing (thor)

much cleaner simulation without wrong colors.

o some undocumented player/missle "mixing" priorities are now supported (thor)

o Added simulation of Atari XL CartCtrl (GTIA-3) pin (thor)

o Added better DLI timing (thor)

o Added sprites on top of GTIA modes 0x40 0x80 0xc0 (thor)

o Removed DIRECT_VIDEO support (thor)

o Correct handling of CPU interrupt bit (thor), LucasFilms keyboard parsing
works now.

o Correct (checked!) support of direct (non-SIO) I/O (thor), SIOPatch no
longer needed (though RECOMMENDED for speed).

o Corrected bug in vertical fine scrolling. (thor)

o Correct emulation of a bug in the 6502 ZPage addressing (thor)

much cleaner simulation without wrong colors.

o some undocumented player/missle "mixing" priorities are now supported (thor)

o Added simulation of Atari XL CartCtrl (GTIA-3) pin (thor)

o Added better DLI timing (thor)

>unit to it. Anyway like I said this is just a thought..
>
>Atari*Dave
>The Hardware Man

SRAM doesn't come in big sizes and is pretty expensive.
Why not use SIMMs. The 30 pin versions shouldn't be a big problem.
I know a place (in Germany, where they sell 1MB simms for 6 bucks.

CU Mathy Van Nisselroy

PS if a MIO can do it without loosing BASIC, other upgrades should be able to do
the same. It IS gonna be BlackBox compatible is it?

I don't have a site, but I do have the schematics. At home. I'll look it up for you.

BTW ABBUC (search for them in Michael Currents FAQ or on the InterNet) sells them for DM5 (about 2.5 dollars, p&p NOT included, but it's 3 or 4 pages size A3 (the siye of two sheets (the size most of us use for their snail mail) of paper and a big envelope.

2607. Auction: Atari Explorer/Antic/ANALOG Magazines/8-Bit Items

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-11 00:00:00 UTC
From: clauction@aol.com
Message-ID: <19980311131001.IAA08441@ladder03.news.aol.com>
Source record: 65068

March Auction - Update 10

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, March 16 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Atari Computer Magazines
A.N.A.L.O.G. Magazine Issues. All includes lots of old advertisements, type-in programs, reviews, editorial, and several articles.
M1. A.N.A.L.O.G. No. 1. Premier Issue. Become a Star Commander. Five Star Treks. What's New for 81. Music Composer. Maze Rider. Type-in Games: Blocked, Maze Rider, Sub. Video Computer System Update. Bugs & Bytes. Atari Stock & Bond Analysis. Reviews: Tank Trap (Quality Software), Kurta Graphics Tablet, Mountain Shoot (Adventure International), IRIDIS #2. -$10.95 dan

M5. A.N.A.L.O.G. No. 5 Graphics! Fine Screen Scrolling, Mixing Graphic Modes, V-Blank Interrupts, Player/Missile. 3-Dimensional Graphs type-in program. Reviews: Shooting Gallery, Jawbreaker, Eastern Front, Filemanager 800, Fantasyland 2041. Stopwatch (type-in program). Is There a Laser Disk In Your Future? VCS Update - Atari Titles for 1982. Atari News: New Video Game to Stomp the Competition Flat (Atari 5200), New Prices, Winter CES. -$8.95 min

M6. A.N.A.L.O.G. No. 6 Using Display List Interrupts. Run BASIC Automatically. Assembler Code Subroutine Adder. Pirating! Speeding Up BASIC. Variable Lister. A Low Bucks Memory Upgrade. Reviews: Pool 1.5, Pacman & Centipede, Intec 48K Board, Caverns of Mars, Dodge Racer, Crush, Crumble & Chomp, Graphics Composer, House of Usher. Type-in programs: Maniac, Typing Trainer, Disk Menu. -$8.95 min

M7. A.N.A.L.O.G. No. 7. Atari: 2019 (Atari in Blade Runner). Zork, Pacific Coast Highway, Ulysses, Deadline, K-DOS, Raster Blaster, Percom Double Density Disk Drive, APX Stereo Graphics Package. VCS Update. Atari BASIC Meets Comples Data Structures. Budget Worksheet, Soundlab, Faster Character Dumps, Dino Battle (type-in programs). -$8.95 min

M8. A.N.A.L.O.G. No. 8. New Products: K-razy Shootout, My First Alphabet, Astrochase, Airstrike, Track Attack, Preppie, Pool 400, Poker Tourney, Player Piano Scott Adams Pirate Adventure (Color version). Bug Alert (DOS Clobbers Page 6 RAM). Type-in programs: Utility #3 Disk Tool, Stuntman!,Budget Worksheet II, Graphic Violence!, Dungeons and Dragons Character Generator. Mixing CTIA and GTIA Graphics, Beginner's BASIC, Missing Capabilities in Atari BASIC. -$8.95 min

M10. A.N.A.L.O.G. No. 10. Super Adventure Games Issue! New! The Atari 1200XL Computer. Fill 'Er Up! type-in program. Accessing Bulletin Board Systems. Epson Printing Modes. Lisp Tutorial. Reviews: Wayout, B Key 400, Scott Adams Adventures 1-12. Programs Listings: Utility #4 Directory Dump, D:CHECK 2, Magic Keypad, An Adventure Game, Halls of the Leprechaun King, Moving Players in BASIC, Word Square, Simple P/M Assembly Language. -$8.95 dan

M11. A.N.A.L.O.G. No. 11. The West Coast Computer Faire. D:CHECK and C:CHECK and Control Characters, Strings in Atari BASIC. Copyright Basics. Reviews: Atari Pascal, BASIC Compilers, Disk Backup Programs, New Atariwriter Cartridge. Program Listings: C:CHECK, BASIC Programming Techniques, Moving Missiles in BASIC, Adventure in the Fifth Dimension. Graphics 7+ Handler. EPSET. -$8.95 dan

M12. A.N.A.L.O.G. No. 12 July/August. The New Atari Computers! New Products: A.E. Squish em, Fort Apocalypse, Shamus II, Necromancer, Spy's Demise, Zaxxon. Atari Puzzle. Notes to the Atari Microsoft BASIC Instruction Manual. Type-in programs: Micropainter Pictures in BASIC, GTIA Expansion, Sound Effector, From Rags to Riches, Multicolor Screen Generator, Total String Search, Live Wire (includes assembly language listing). Happy 810 Enhancement. -$8.95 min

M14. A.N.A.L.O.G. No. 14 November/December. Features/Articles: Fine Scrolling Part 2, D:CHECK, C:CHECK, Control Characters. Reviews/Profiles: Atari Logo, Rhymes & Riddles, Getaway, Combat Leader, Drelbs, Austin 80-column Board, Atari 820 Printers, Monkeys, Math & Merriment. Program Listings: An Extra Graphics Mode, Hexpad, Conversions, Retrofire, Limberjack, mUse, A Disassembler in Atari BASIC. New Products: Pooyan, Blue Max. -$8.95 min

M15. A.N.A.L.O.G. No. 15 January. Inside the New 600XL. Piracy Survey. Knights & Chalices, Music Synthesizer. Bricklayer's Nightmare. Alternative Keyboard Handler. -$8.95 min

M16. A.N.A.L.O.G. No. 16 February 1984. Atari Graphcis. -$8.95 min

M17. A.N.A.L.O.G. No. 17 March 1984 -$8.95 min

M21. A.N.A.L.O.G. No. 21 August 1984. Atari Printer Utilities! Proset, Matt*Edit, Graph Es, The Fergee File Printer, The Analog Card File, and two super games: Avalanche, Spy Plane. -$8.95 min

M24. A.N.A.L.O.G. No. 24 November 1984 -$8.95 min

M27. A.N.A.L.O.G. No. 27 February 1985 -$7.95 min

M28. A.N.A.L.O.G. No. 28 March 1985. The Atari and Money Management. -$7.95 min

M29. A.N.A.L.O.G. No. 29 -$7.95 min
M31. A.N.A.L.O.G. No. 31 June 1985 -$7.95 min
M32. A.N.A.L.O.G. No. 32 July 1985 -$7.95 min
M33. A.N.A.L.O.G. No. 33 August 1985 -$7.95 min
M34. A.N.A.L.O.G. No. 34 September 1985 -$7.95 min
M35. A.N.A.L.O.G. No. 35 October 1985 -$7.95 min
M36. A.N.A.L.O.G. No. 36 November 1985 -$7.95 min
M39. A.N.A.L.O.G. No. 39 February 1986 -$7.95 min
M40. A.N.A.L.O.G. No. 40 March 1986 -$7.95 min

M42. A.N.A.L.O.G. No. 42 May 1986. Modern Relief for Modem Problems. This Issue: Bits & Pieces, Atarzee (type-in game), Printing Utility (type-in), D&D Character Generator II Part 2, Bonsai (type-in, creates trees), M/L Editor. Including ST-LOG.The 8-bit Blues: Trials and Tribulations of owning a state of the art computer. Type-in: BASIC XL/XE Switch. Reviews: Hackers (book), Spellbreaker, ACE 80/80XL, Battalion Commander, Colonial Conquest, Track and Field, Zorro. -$7.95 min

M43. A.N.A.L.O.G. No. 43 June 1986. Atari in the Home: A Piece of Cake. With: Home Shopper, Calendar Printer, Home Inventory, Electroids. Plus: ST-LOG. -$7.95 min

M44. A.N.A.L.O.G. No. 44 July 1986. Special Hardware Issue: Arm Your Atari, RAMcopy!, 8-bit Parallel Interface. Plus ST-LOG. -$7.95 min

M45. A.N.A.L.O.G. No. 45 August 1986. Special Language Issue: BASIC XL's Hidden Memory, Multi-Lingual Atari (Guide to Programming Languages for Atari 8-bit Computers), Stencil Graphics (An easy way to create high-speed special effects in BASIC), LBASIC. BASIC Editor II. RAM DOS XL. Roll Em (type-in game). Troll War (type-in game). Reviews: Atariwriter Plus. Advan BASIC Compiler. Ultima IV, Sargon III, Ballyhoo, Whistler's Brother. -$4.95 min

M46. A.N.A.L.O.G. No. 46 September 1986. June C.E.S and the 8-bit Atari. Magic Spell (type-in to spell check documents produced by AtariWriter and others). Soft Touch. Atari Touch Tablet tutorial. Moonlord (type-in game). Launch Code (type-in game). Reviews: Blackhawk, Fooblitzky, Racing Destruction Set, Monday Morning Manager, Computer Baseball, Micro League Baseball, Page Designer. -$4.95 min

M47. A.N.A.L.O.G. No. 47 October 1986. The Xanth 8-bit Demos. DiskFile (type-in, helps 1050/DOS 2/5 owners access previously unavailable sectors for comments). Deathzone (type-in game). DLIs: A Minute to Learn. Pixel Perfect - how to effectively use graphics and painting software on your Atari. Reviews: COVOX Voice Master, Graphics Magician, NAM, Star Raiders II, Star Fleet I, Super Boulderdash, Parrot (voice/sound digitizer). -$4.95 min

M48. A.N.A.L.O.G. No. 48 November 1986. Status Report - What does Atari really think about it's 8-bit line? How to build your own Atari light pen. Modem Chess. Reviews: Comp-U-Temp (Connecting Temperature Sensors to your Computer). Panasonic KX-P1092. P:R: Connection. SmarTEAM Modem, Neverending Story, Buzzword, Infocom Trinity. -$3.95 min

M49. A.N.A.L.O.G. No. 49 December 1986. Atari 8-bit Gift Guide. ST-Log (ANALOG's ST magazine: C-Manship). Smiles. Brickworks. Fortune Wheel. Reviews: Hardball!, Beach Head II, Wizard's Crown, Translyvania, Crimson Crown, -$3.95 min

M50. A.N.A.L.O.G. No. 50 January 1987. Graphics Issue: Picture Storage Techniques, Krazy Katerpillers, Screen Scroller. Hot Poker, a fast and convenient machine language program that helps eliminate Please Wait Initializing. Screen Scroller, add scrolling text to your home movies/video tapes. ST Coverage: ST Software Reviews (Little Computer People, Time Link, Music Studio). Using Picture Files in ST BASIC. Reviews: Fight Night, World Karate Championship, 500XJ Joystick, Mercenary. More... -$3.95 dan

M51. A.N.A.L.O.G. No. 51 February 1987. Sixth Anniversary Issue. A History of ANALOG Computing. The Tablet Typist (add text to your own touch-pad generated pictures). Slither (type-in maching language game). ICD Future. Starlanes (type-in game). An Introduction to the Vertical Blank Interrupt. The System Rerun Button (rewire your RESET key to rerun programs automatically). Reviews: Chessmaster 2000, Top Gunner Collection, Atari Planetarium, Great American Cross Country Roadrace. -$3.95 dan

M52. A.N.A.L.O.G. No. 52 March 1987. Entertainment Issue. Devil's Doorway (type-in game). Rambug II (type-in game). The Vertical Blank Interrupt: Scrolling. Beyond Zork. Midas Maze. Battle Stations! (strategy, tactics, and tips for potential wargame generals). Reviews: Beach-Head II and Raid Over Moscow, Genie, Theatre Europe, Golden Oldines, Wargame Construction Set, Crosscheck, Atari ST Tricks and Tips book. -$3.95 min

M53. A.N.A.L.O.G. No. 53 April 1987. Music During the Vertical Blank Interrupt. Background Printer (device handler). Floyd the Droid Goes Blastin (type-in machine language game). Multicopy (versatile utility for copying files). Modems and the Atari 8-Bits. Reviews: The Learning Phone (Atari Plato cartridge), Blazing Paddles, Carina BBS, Flight Simulator Scenery Disks, Mail Order Monsters, Moonmist, Rommel Battles for Tobruk, Video Vegas. -$3.95 dan

M55. A.N.A.L.O.G. No. 55 June 1987. Programming Issue. The Making of Atari Writer Plus. Fast Sets (BASIC Character Set Loader). Trade Secrets (Programming Tips). Window Graphics (Window sections for 8-bit programs). Dragonlord Dungeon Editor. Reviews: Speed King, Star NX-10 Printer, Age of Adventure, Return of Heracles, Ali Baba and the Forty Thieves, Hollywood Hijinx. -$3.95 min

M56. A.N.A.L.O.G. No. 56 July/August 1987. Four-Star Software Issue. Type-in Programs: Polar Plotter, DiskMend (Access single, double, or enhanced density sectors directly), Bio-Signs. Four-Star Software Picks - Editors list their favorite programs. 8-Bit News. Reviews: Warship, Battle Cruiser, Solid Gold Software (Pitfall and Demon Attack), Music Painter. -$3.95 min

M57. A.N.A.L.O.G. No. 57 September 1987. Troll War II (type-in game) Part 1. June 1987 CES Report. Basic Diet (ST type-in) eating program. Label Maker. Reviews: The New Aladdin, High Roller, Phantasie II, Autoduel. NFL Game Analyzer. -$3.95 dan

M58. A.N.A.L.O.G. No. 58 October 1987. Adventure Issue: The Wizard - Adventure Creation for the Nonprogrammer. The ROBOX Incident (type-in program). Castaway (type-in program). Artificial Intelligence. Video Game Digest - Buyer's Guide to Video Game Systems. Reviews: Bureaucracy (Infocom), The Lurking Horror, Night Mission Pinball, Robotron 2084. Troll War II (2nd half) -$3.95 min

M59. A.N.A.L.O.G. No. 59 April 1988. History of Video Games: Part I: Our Game Experts Take a Look Back. Shopping for the computer user: 8-bit product guide. Upward. 128KB SRAM costs 9DM (5 Bucks) in Germany. That is not very expensive and two of this chips make a complete 256 Ram Expansion. You need only an adressdecoder and the ram expansion is complete.(btw: 512KB SRAM cost 40DM/22USD, when you want to have a 1MB upgrade).

Stefan Birmanns

The 7800 sounds terrible (I think the sound chip is actually the 2600's).
This is why some manufacturers (like Lucasfilm when they translated Ballblazer
to the 7800) put a POKEY chip for better sound effects.
Ballblazer sounds EXACTLY the same on the 7800 and on the XL/XE...
Greetings,
Bertrand.

Yes please post the plans. Sounds cool. I remmber being interested
in the Transkey way back. Is this a complex circuit to build? I
always have spare PC keyboards around.

Six or seven years? Odd; I exchanged email with Mike, and IIRC
talked to him on the phone (I might NOT be remembering correctly),
at the "official" FTE contact addresses/numbers, just before
Christmas 1995. I was going to my syster's place in Phoenix for
the holidays and was hoping to stop in and see FTE in person. As
it happened, I got too busy and the visit never materialized. In any
case, though, Mike/FTE was still in business as of at least early December
1995, which is a little over TWO years ago now.

It's a darned shame, too, seeing as how he has, or at least HAD, c the
rights to all the ol' ICD (and before them, OSS) goodies! Wouldn't I like
to see THAT stuff back on the market. I s'pose those rights won't be back
on the market anytime soon, if ever, though. *sigh*

Well there we get back to memory refreshing. SIMMS require refreshing. Just because you can buy memory cheeply doesn't mean that you can build the necessary circuitry to maintain the memory refreshing. Look at the MIO. Even when the MIOs were built the 256K SIPs were inexpensive, but the cost of the MIO wasn't. Yes I know that it had extra circuitry for SCSI and the printer and serial ports. Actually this could be include at very little cost and a software patch or perhaps as an add on. You know something like the Black Box does with their floppie drive board. What happens if you lose power? Phoof, you lose everything in memory. There is no way to keep the informatin during a power outage. In order to keep memory, you have to be able to supply power to the memory modules and also maintain memory refreshing during this peroid. This all adds to the cost of the unit and to its footprint. This can be kept to a minimum by useing SRAMS. This is something that I also have looked at. Yes I know that SRAMS ares expensive, but that are many benifits to using them. When building something like this one must weigh the cost vs benifits. I like the benifits, and am will to pay the higher cost.

> CU Mathy Van Nisselroy
>
> PS if a MIO can do it without loosing BASIC, other upgrades should be able to do
> the same. It IS gonna be BlackBox compatible is it?

Personally I do not own a Black Box. I do have serval MIO's though. I would like to have it work with atleast the MIO. I am assuming that if it does work with a MIO it will also work with the Black Box. I will have to check into that though.

>FidelDahan@aol.com

I downloaded a "file version" of Bounty Bob Strikes Back, from SOMEWHERE
on this Net -- alas, I no longer remember where; I hope I saved the info
in a misplaced file which I will someday (re)discover -- and it didn't
work very well on the REAL Atari either. So it may or may not be the
emulator's fault.

Oh, and I own the original cart too!

Hello to all,

I was given an email earlier this morning from an individual who
gave me a link for the Techstocks website, within the website it
reference that JTS had filed an 8K form for the sale of assets,
specifically Atari to Hasbro Interactive.

I decided the only way to know for sure if this was fact or fiction
was to go to the source, since JTS is a publicly traded I went to the
SEC site at www.sec.gov

So go to www.sec.gov, go to the Edgar Archives, select 8K and type in
JTS for the ticker and Viola!!! You get for February 23, 1998 the sale
of most Atari assests to
Hasbro for (GET THIS!!!) only $5,000,00!!!

Its real, its true and its official, Atari has been
sold!!!!!!!!!!!!!!!!!!!!!!!!!!!!

XFD isn't a format at all.It's just raw data.The first 128 bytes is the first
sector,the second 128 bytes the second sector,and so on.

IF you're talking about INDUS.SYS,then that won't work.Even with INDUS.SYS
loaded into the disk drive only SDX would know how to use it.And he couldn't
run INDUS.SYS anyway since it's not a COM/OBJ file.
(it's some weird SDX format)
I'd assume the same with DOS XL's software.It won't make his Indus GT act like
a UltraSpeed drive or anything.

What'd I like to see is a device handler for the IBM to use Atari disk drives.
Then you just need AtariDOS for MS-DOS (like MSCDEX does with CDs) so you could
access files.And sector editors could be used to access disks.And since it
would be implemented as a real disk drive device handler it would work with
disk-buffer programmes.(unlike MSCDEX's filename handlers)

Well I used TextPro and TextView (or is that called something else) a lot.
But mostly TextPro for writing to a pretty girl.I just can't stand
hard-writing.But looking back it does seem a little inpersonal.And,of course,
for programming.At least back in the old days.

When I got to the IBM I was amazed at the crapiness of it all.When my friend
couldn't understand what I meant by "setting the columns to 40" I just thought
that he was incompetant.But aparently if you don't press RETURN every 80
characters rather than the line just wrapping like it does in TextPro or vi
(UNIX,Elvis for Linux)
it just keeps going,horizontaly scrolling the screen to make one giant physical
line.That might be alright for charts but it's real anoying for letters.
(luckily I found UED,the "useful editor")
This also happens with text-file viewers.
(but try LIST from the simtelnet)
I can tell UED to automaticly insert RETURNs at the 80th column but just
writing un-formated text is nearly impossible on the IBM.

And I could go on and on on GW-BASIC.Strings being limited to 128 bytes or some
such.And don't even try to comprehend the "record access" functions.
(you'll blow a synapse!)

>6 works!) and this is the only full-machine emulator to date that

Was this ever a problem.It seems pretty simple to implement to me.
Xformer 3.60 for MS-DOS supported this.

For those who don't know,755 affects how inverse characters (characters with
128 added to their ATASCII code) work.You can cause a inverse character to also
appear as a normal character.Thus by changing this location back and forth you
can create blinking text.There's also a option for inverse text to appear
up-side-down,as a solid white block,or a blue block (invisible).

Since the cursor is simply a inverse version of whatever character is under
it,this affects it as well.
(a inverse character under the cursor yields a normal character)

Since you mentioned me by name I guess I better try responding! :)

As someone else posted, some disks may have single games on them, in which case you load them simply by: turn on disk drive, insert disk, turn on computer (try with or without holding down the OPTION key, to enable/disable built-in Atari BASIC).

It sounded to me more like you may have many games on the same disks. In that case, they're most likely "binary load" games. For these, you have to get to a DOS prompt. Some disks may have DOS on them, so if you boot following the procedure in the previous paragraph, holding down OPTION, you end up with a full screen menu, maybe DOS 2, where one option is L. Binary Load. You'd use that to run any of the binary load games on the disk. To see what files are on the disk, enter [A][RETURN][RETURN].

If you have BASIC games, you have to boot with a disk with DOS on it, don't hold down OPTION, and at the READY prompt enter RUN "D:FILENAME.EXT". You would have had to made it to DOS previously to find out what filenames are on the disk to run.

That's probably pretty dense, but maybe enough to get you going!

Bill Kendrick's "newbie" FAQ may be helpful to you. That's at:

http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

I would guess JTS was too strapped for cash to try to do anything with
Atari. Perhaps that is why they were not open with Atari, they wanted
to liscense stuff to make money.

>have some modules compiled in to boot up.

Sorry if I confused you with the DOS/Unix thing. For reference,
MS-DOS and Unix are separate operating systems. Unix doesn't "have
DOS built in," nor does it "use DOS." Unix may be able to read a DOS
filesystem. The fact that you had to load a kernel module to do so
with Linux is just a detail of how your Linux kernel was built; on my
system, DOS FAT filesystems can be read without any modules, but
that's not relevant here.

So DOS and Unix are two totally separate systems. I wrote the program
under Unix, so I named the program 'unix2atr.' I probably should have
used an operating-system-independent name such as 'dir2atr,' but
someone else just announced a program that does the same thing by that
name. I haven't had time yet to check to see how the two compare.
(Though I do feel kindof bad that the author of that program didn't
look around and find my program first, so we could have worked
together to get a program with all the features of both; i.e.,
cooperation instead of competition.)

What is relevant is that my program is distributed as C source. It
compiles just fine under Unix systems (such as Linux). It probably
compiles fine under MS-DOS, though I haven't tried it; it may need
some patching up depending on the libraries that are available with
the MS-DOS compiler. Since most MS-DOS users don't have a C compiler,

it might be nice for someone to compile my program to generate a .EXE file. If that were done, I could also put the .EXE file on my web page.

Of course, there are some bugs left in my program. In particular, it still doesn't set up the boot sectors properly so that the created images will boot, even if DOS.SYS is written to the image. However, as long as you don't try to boot from the image, it should work just fine.

I would love to hear some feedback from people who have played with the program.

So perhaps we should petition Hasbro to make some of the old Atari
8-bit and ST stuff freeware.

Maybe make the custom chip details public, and license theem for free
non-comercial (or limited production, say under 1000 units) use.

Perhaps relase the source for the various operating systems under
something like the Netscape Public License.

I think we should think about what they could do that would:
a) make us hobiests happy
b) not provide any advantage to their competitors
c) not deprive them of potential future revenue
d) not cost them much of anything to release

(speculation)
10. Hasbro wants to sue somebody because they are copyright freaks. (Nobody interested in Atari has any money, so they can't get any money.)
Comment on sale of Atari to Hasbro.
From my point of view, it means that a large, active (in Atari) corporation now owns the rights to all Atari copyrights.
Being a bit paranoid, I'd suggest that any sites carrying Pac-Man, Star Raiders, or any other Atari held product should think about what Hasbro might want to do with those products, ie. be careful about having Atari products up for download. They may justifiably say such activities interfere with their ability to make a profit, even if the activities are without profit motive.

Guys,

In all seriousness, the Jaguar is DEAD, it will not be revived, there
wont be a Jag II, forget any hopes on that, there is a possibility
(slim) for the Lynx though. If there will be
a console system it will be a Project X console or this rumor of a 68040
console, but
guys get it through your heads, Jag is DEAD. I love my Jag but its
DEAD. Look for
Retro PC Atari titles and titles for other systems, and hope for a
Project X licensing with
Atari on the case and Atari Retro Project X software, THAT is the only
reality here.

We all love the Jag, but it is DEAD, get used to it, no Jag in the
future.

Perhaps the Atari 26000 ??? Maybe.

Curt

Feel free to bring the drives to the next meeting of the Long Island
Atari User Group
I happen to be an electronic technician and will help you diagnosis
them.
You live in Suffolk County and the meetings take place in Nesconset!
The address is:
The Nesconset branch of the Smithtown Public Library
127-20 Smithtown Blvd
Nesconset, NY
and the next meeting will be Sat Apr 4th at 12:30 held jointly with the
Old Hackers
who meet in Nassau Co.

If you need directions you can call our BBS at (516) 783-4634 or send
me e-mail
indicating where your heading from and I will be happy to send them to
you.
Directions will soon be available on our website http://liaug.com

Patrick J. Mulvey Pres. LIAUG

Oooh... a boasting contest...

Qbert - can't remember, I beat it though. The only game I was every really
really good at. Still am, btw. :) (Arcade and 8bit versions)
["I beat it" means I could play it without dying more often than I would
gain a new life.]

Defender - Atari8bit, 10 million? I think I went to either 1 million or 10
million and gave up because it didn't roll over. Played over 24hours
continously.

Asteroids - pretty sure I rolled it. I can't remember the options though, I
was probably playing with shields & wrap. Played over 24hours continuously.
Atari8bit of course.

Star Raiders - hardest level, got ranking below highest [a port to the IBM
would be fun to play with :)]

PacMan - 10 keys I think, never beat it. (My brother did play this for nearly
24 hours, he was much better than me.) Atari8bit of course.

I doubt it. After all, why pay $5 million for all of the rights just to avoid licensing one of Atari's patents? Nintendo, Sega, and Sony are always bumping into one or more of Atari's patents every day, yet this doesn't bother them one bit.

>2) Hasbro is only interested in the game franchises so that they can make

I apologize if this sounds rude, as I don't intend it that way.

What amounts to the changing of hands of Atari ownership, IMHO, is pretty darn relevant to any Atari-related newsgroup. I would imagine that most Atari fans were elated at the news. Even though I don't know what plans Hasbro has for their newly acquired Atari properties (which, BTW, does include the ST line), I'd bet my bottom dollar that it's a whole hell of a lot more than what JTS has done.

I don't blame anyone one bit for crossposting. To an Atari aficionado, this is front page news; it deserves to be seen by anyone who shares even a remote interest in anything to do with Atari.

Source record: 64858

Firstly: the atari 8bit can't do 640 x 400, even in two colors. The maximum is 320 x 192, at least for standard atari's which I hope is what we're talking about.

Secondly: this notion of an intermediate program which will spoonfeed the atari a dithered image... I don't buy it. I think the best we can work towards is a text-based browser, usenet client, and IRC client which runs native on the 8bit.

From: chris <NOSPAMroom101@NOSPAMix.netcom.com>
Message-ID: <6ea9l4$l68@sjx-ixn6.ix.netcom.com>
Source record: 64859

I recently obtained a 600xl, cleaned it up, looks very nice now. one problem: it doesn't work! Comparing it to my 800xl, I get the same color screen as the background of the Self Test. Just hangs there. Power on led lights, there's good power to the video modulator. Is it worth fixing or should I relegate this unit to parts for others? would like to fix it and install the sio2pc and 64k upgrade as a gift for a friend... would rather do this than buy another 800xl, unless that would be much cheaper.
Should I try swapping chips out of the 800xl and into the 600xl as a means of finding the bad one or do I run a real risk of blowing a currently good chip? Has anyone published a spec sheet listing proper pin-out voltages? I could diagnose it easily this way. I'm kind of hoping it is the DRAM, as I was planning on swapping them for 64k anyway.
Also wondering why a single voltage power supply has so many damned pins on the connector! Could this be redundancy, owing to the shoddy soldering job on some of these boards or is it more likely Atari chose that plug/socket combination because it retains the plug better, that is, no unexpected pull-outs in the middle of an important file.
Thanks in advance,
Chris

well,,,, it is a pretty big board. lots of ICs. uses a CRT9007
controller chip for video. looks like 4K of screen memory. an EPROM.
looks like it plugs into the second PBI socket on the MIO, so it may
even work as a stand-alone device!

Wow... A once million dollar business, Atari has been sold for a mere
$5,000 US... the once powerful dominator of the 80s video game industry
has been reduced to $5,000... Do you know what Hasbro plans for the Atari
Fuji symbol et al?

Always e-mail your friends in this base to ask about people you are buying from.. also sometimes it is good to ask for a reference. I know these can easily be made up, but unless the guy really wants to scam you out of some cash, I doubt he will get 3 of his friends to pretend to be references. I have done about 15 internet transactions, (about 13 sales and 2 buys) and everything has always turned out fine. (I am actually waiting for a friend in the US to receive an Antic magazine shipment I sent last week... :) Perhaps I am lucky? It's very disheartening to hear about these things. I have seen about 5 complains from different people who have been had by dishonest people. YOu did say you live in Norway. If these people sending you stuff live in the US or Canada, that would take a good 2-3 months to reach you. (I sent COMPUTE magazine to New zealand from Canada.. it took about 4 weeks to receice the money order and it took about 10 weeks for the guy to receive his computer mags..

How long has it been?

Geez, and I thought I was an Atari gamer in my youth. I played defender
for about 4 hours and thought I was some grand champion. HOw can anyone
playu a game for 24 hours? Thank god for the Pause key...

I guess that was back in the days when we had nothing better to do..

Never did figure out how people scored better than Lieutant in Star
Raiders though...

The reason i would rather not use gr. 15 is that I want the program to run on an atari 800 or 400 if i can. Just my own preference at this point.

>And how do I adjust the drive speed?

My Indus GT drive runs at about 295 RPM's according to the GTRPM utility and it works fine. I don't think you can manually adjust the drive speed.

There's an adjustment pot inside the 1050's at least. I know, because
that's the way we made bad sectors in the old days. I have never opened an
Indus or looked for it in the XF-551, but expect there's one there also.
Take Atarian care

>There's a setting in the drive controller for it.

Just because the controller has a flag for it doesn't mean that it
will actually do the job. I'm not sure in my case if it is because of
the controller or the drive, but it behaves exactly the same
regardless of the FM/MFM setting (yes, you can toggle that under
Linux).

Maybe I need an old 360K drive mechanism to do FM?

This makes sense too. First of all the Lynx is by no means outdated
considering how far handheld consoles go these days. Secondly no one
seems to want a Tiger Game.com, maybe they want and Atari Game.com.
Secondly, purchasing two game companies leads me to believe they have
something planned. Perhaps Hasbro will make a console, portable or
standard (or even liscense Project X) and use technology from both
companies or names to form something.

I would think the want the Atari name perhaps for something else. Maybe
they want to release the Jaguar 2 and try to beat Playstation, in
theory it is more powerful than current consoles and could compete with
the next according to the few rumors surrounding it.

Thanks for the info. I read the document and one very interesting part
is
the fact that Hasbro will take the rights to the website domain
"atari.com"
It looks like Hasbro will be using the name Atari for something, but
what
that might be is still up for speculation.

When Atari bought into JTS there were many who said that Atari was DEAD!

It definately looks like some restoration will be happening.

Thank you Hasbro in advance for whatever you may do!

AtariGames.com is own by Atari Games Corporation a subsidiary of
Bally/Midway

2675. "dead" 600xl : What to do?

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-12 00:00:00 UTC
From: Johnny Zymurgy <thehelmet@hotmail.com>
Message-ID: <6e81qn$cms@dfw-ixnews8.ix.netcom.com>
Source record: 64896

I recently obtained a 600xl, cleaned it up, looks very nice now. one problem: it doesn't work! Comparing it to my 800xl, I get the same color screen as the background of the Self Test. Just hangs there. Power on led lights, there's good power to the video modulator. Is it worth fixing or should I relegate this unit to parts for others? would like to fix it and install the sio2pc and 64k upgrade as a gift for a friend... would rather do this than buy another 800xl, unless that would be much cheaper.

Should I try swapping chips out of the 800xl and into the 600xl as a means of finding the bad one or do I run a real risk of blowing a currently good chip? Has anyone published a spec sheet listing proper pin-out voltages? I could diagnose it easily this way. I'm kind of hoping it is the DRAM, as I was planning on swapping them for 64k anyway.

Also wondering why a single voltage power supply has so many damned pins on the connector! Could this be redundancy, owing to the shoddy soldering job on some of these boards or is it more likely Atari chose that plug/socket combination because it retains the plug better, that is, no unexpected pull-outs in the middle of an important file.

Thanks in advance,
Chris

Hehehee.. I'm not sure I like any of them. Someone wanted to start some
rumors, here is one. I guess you all know of VM-Labs which are supposed to
cooperate with a number of big companies. I have no idea what Hasbro does,
but maybe JHasbro+VM-Labs have something to do with this as well? :-)

Another possibility would be that it would be esier for a seconde company
to buy out the computer part and TOS. As they sold the whole shit for
5 mill, I guess the computer part would be very cheap as I guess this is
not what they were after in the first place.

Well, maybe IBM could buy the computer and release a PPC TOS box, or Compac or
Dell could buy it just for the fun to rival Gateway2000? The price for the
computer part would be a fart in space for those guys. :-)))))

Anyway, here you are.

Pah, that was too easy. The only thing you had to do was to push the
fire button permanently so you became invisible.

Try to roll over the score with the XL/XE version of Defender!

Tschuess,
Frank

2678. Atari Games Division and the Recent Selling of Atari

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-12 00:00:00 UTC
From: a-trashman@aci.net
Message-ID: <6e840qbbp0@208.136.114.108>
Source record: 64899

The arcade part of Atari that makes all those cool games we play in the arcade now split off from Atari a while back and was not part of the deal. I think they are affiliated with Williams. Be sure that if the arcade division was part of the deal, Atari would have been sold for more then $5 million.

Well, I have since tried to use a null-modem cable to talk to my PC
with no success. Again, anything typed on the Atari shows up on the
PC but nothing from the PC keyboard appears on the Atari. I have tried
all sorts of echo/etc configurations and am ready to just declare that
the 850 I I bought is a crapper. I'll try Kermit as a last resort (anyone
know where I can get it easily for my Atari?) and let you know....

Thanks,

Aaron

If they aren't intrested in the computer line or TOS, perhaps we can see
TOS under a open license or even freely aviable. The same goes for the
hardware schematics, sadly there isn't much money left in a computerline
that was abadoned some 5 years ago, even if one as a enthusiast like myself
don't like that fact. Today people buys a PC not a homecomputer... ;-(But
perhaps Hasbro are more open than JTS where.

Just my 2 cents.

Regards..

: mod. Anyone know of any other outfit that carries them or does anybody have
: a couple they would sell. Mouser had them for $2.40 and there's no point in
: paying $10 a piece for them, so anyone trying to gouge has no point in
: responding to this. Mouser is cool because there is no minimum order and
: they charge you REAL shipping costs... you can order just a couple of chips
: if you like.

I have some I think. Let me check...

Hmm, okay. I have... (counts... wow. I forgot I had so many little chips. I think that was as 4114? Remember playing with NTE chips? You never found 'em anywhere 'cept in hobby stores anyways...)

These RAM chips are labled M5K4164S-15 (in gold) and M5K4164P-15 (in black). I'm pretty sure those are 15ns 64k x 4 RAM chips but I could be wrong. Now, I have no idea at all if these things still work, since I've had them forever (I think I had pulled them out of an old S-100 card). I have about 13 of them and you're welcome to take them all, provided you pay for the shipping. Or if you're anywhere in L.A. maybe you can just pick 'em up. :)

Uhm, they're all resting with a bunch of other CMOS chips on one of those plastic breadboard thingies, so I'm not sure exactly how I'd ship them. Hmm, wow, I got a VCP200 here too. I don't recall ever using it though. I haven't played with these things in like, forever. :P :)

Well, I haven't received any responses yet. I shall still wait patiently. To mention, I have found the FAQ by Michael Current, but I did not see anything contained within that mentioned how to load games from disk. It did mention though many paragraphs about DOS and everything relative to that. I thought the 130XE had built-in DOS--apparently not. Is the 810 drive compatible with the 130XE. Again, any and all details would definitely be appreciated, either from you Michael, or any other dude who would take the time to oblige. Thanx once again in advance.
OH, just came to mind. What setting should the drive code switches be set to on the back of the 810 drive. LMK on how it is printed exactly as it is on the drive. Thanx. Take care.

Source record: 64908

hi st/falcon users!

to connect your st/falcon as a server to a real 8bit
like ape you can download the brilliant mouse-driven software
from my homepage...

unfortunatly it uses an own diskimage format and not standard
XFD/ATR...

i coded in omikron-basic a 1st version of a xfd/atr-to-di-converter
but it just works aprox. 80%... but i am working for it...

interested in screenshots and more?

try

http://wwwstud.ira.uka.de/~s_tomczy/dj800.html

bye, heaven/taquart

ps.
included in my package are "dos 2.5", "asskicker demo by shadows"
(>=128k),
"total daze"-demo by tight (>=128k) and my fave macroassembler
"Macro ass xe v4.3" (>=128k)

I included total daze-demo because it uses an own sio-routine and
as it runs perfectly with dj-software it shows 100% compatibility of
the sio-routines... =)

Ok, this is the way to change the display list in assembler:

This was written by Jerry White, there are another ways to achive the same thing, if you need more info please e-mail me and i will send you more listings.

```

1. Connect the drive to the Atari, of course both equipments must be off.
2. Turn on the disk drive.
3. Insert the disk you wanna play.
4. Turn on the Atari holding down the OPTION key.
5. Connect a good joystick.
6. Enjoy your game.....

Greetings from Mexico.

2695. Repair of disk drives

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-12 00:00:00 UTC
From: Williams <rrwillia@suffolk.lib.ny.us>
Message-ID: <01bd4dcf$5af4bec0$ae5cadc7@SuffolkWeb.suffolk.lib.ny.us>
Source record: 64916

I have just recovered from storage my son's old atari hardware from the days past when he ran the "South of the Border" atari BBS on Long Island. I was seriously thinking of re-establishing the BBS, assuming there is continued interest. Unfortunately in checking out his old hardware which includes 3 drives (1050, 1050 with US Dobler, and Indus GT) only the Indus seems operational and maybe only partly operational. In looking thru the manuals on-line I do not see any Field Service Manuals (FSM). Can you give me any suggestions on where I can get a copy , hopefully on-line, of the FSM for the 1050 and/or GT? ------Bob

Is there anywhere I can complain ? Anybody to notify ? I think we should
put a page somewhere of bad traders. I think it's very hard to know if they
are sincere or not. I also got another reply to confirm Downling as a bad
trader too, so I lost all my money I guess :-(
A bad trader page would be very helpful

It occurs to me that if we all pooled our money together, WE could have
bought Atari! C'mon guys, 50 of us with $100K a piece could do it.

The layoff had to do with Hasbro doing away with unprofitable toy lines and
closing down an out of date factory. Nothing that doesn't happen from time to
time.

Whew! i want to say that I dont care if Hasbro does nothing with Atari. Just so long as Atari didn't die at the hands of the Trameils!!!! I hope this all works out and Atari escapes to Hasbro. JTS is about to be eaten by stockholders.

> Why wait months when we can start now? :)

Yeah, why not? :) Seriously. not more than three months ago I was reading that Atari and the logo is still one of the most reconized brand names in the world. On par with Coke, and RCA. My pet theory is has Hasbro interactive/Tiger will become Atari for name awareness purposes. Rumors about a year ago were running around that Tiger was developing a console system. I imagine that, even with the bad press Atari has gotten, an Atari system will sell better than a Tiger system. In the short term, I imagine that we'll see retro games with Atari on it. Let me throw a few more logs in the rumor mill. (Mostly from speculation) 1. Notice that midway and WMS were spliting up? I wonder if Atari Games will come available for sale? hmmmmm... 2. Everyone is saying Project X. I think if that was the case, next Generation would be crowing louder. They know who the Project X partners are already. Oh the other hand, maybe thats why they didn't want to say to much back in Janurary. in either case, I'm sure we'll hear it there first. 3. Yars Revenge X... <drool>

Well for one that would take up 32k.
For another,why?

Since HTML isn't specially made for 80 or any other columns it should be usable with 40-columns.

Why not?
At this point I wouldn't count anything as frivolous.I have some "PORN" stuff that I'll have to upload to somewhere at some point so it doesn't die with my decaying disks.
(like that Atari point-of-sale demo with the words changed;but I think that's already up)
But what's a "BANNER"?

>Any help would be appreciated. Thanks.

I'd just BUY a 800XL or 130XE and leave the 800 to play old games like Ultima
that don't look right on a XL/XE.
The artefacting colours are swaped on the XL/XE machines giving you green water
and blue grass in Ultima 1-3.Ultima 4 has a option to swap colours to get the
right effect.(press control-X while booting)

I'm not sure I follow.How do you not use DOS with UNIX?
Isn't DOS built into UNIX computers like it is on the ST?
(built into the OS,that is)
I've never heard of UNIX "boot disk" software like you have on the Atari.
(the software accesses the sectors directly instead of asking DOS for files)

Sorry if this is obvious,but the closest to UNIX that I've used is Linux which
loads DOS (FMS and sector-access) from "object module" files.But you have to
have some modules compiled in to boot up.

Net-Tamer V 1.10.1 - Test Drive

2712. wanted: SIO2PC cable

Newsgroup: comp.sys.atari.8bit

Hi,

...is there anybody out there who could make an SIO2PC cable for me? I'd do it my self if I could, but I'm really _terrible_ with a soldering iron... and have several pieces of computer equipment, an amplifier and a broken electric guitar to testify to that... :-(

If anybody could name a decent price, including shipment to the Netherlands, I'd be very happy to send the money in advance. Please e-mail if you could help me!

Thanks,
Sidney Cadot

Too many to list, but here is my selection:
- Star Raiders + Star Raiders II
- Infocom adventures
- Boulder Dash + Boulder Dash II
- Pole Position
- Alternate Reality series
- International Karate
- Defender
- Dropzone
- Draconus
- Zybex
- Miecze Valdgira + Miecze Valdgira II
- The Brundles
- Cavernia
- Ultima IV
- Lode Runner
- Line-Up
- Seven Cities Of Gold
- Dredis
- Jr. Pac-Man
- Krucjata
- One-On-One
- Alien Swarm
- Hawkquest
- Fort Apocalypse
- Montezuma's Revenge

and many more!

Last thing I did with the 1200xl a few months ago was make a music program that let me draw on the screen with a light pen and create multi voice music. Heavy white noise 'distortion' background with harmony on top, pretty cool, also pretty useless.

dougk

I have had a lot of luck with DejaNews; a person's posting history can be a good hint as to whether they're legit or not. Also, I like to lurk around newsgroups for a while to get a feel for who's posting what (doesn't do much when buying from a 1-time seller). I like to buy stuff on ebay, and it's always reassuring to see someone with a good rating there. I have not been overtly cheated, although I have been disappointed with stuff not working/etc. I kind of learned my lesson when I freaked out after sending a guy a big check and not being able to get a hold of him for a couple of days. I posted a "warning" notice on the newsgroup and canceled the check and, much to my chagrin, was flamed by at least a dozen people who had bought from him and gave nothing but rave reviews of his business style. Live and learn....

Well, you can get a little more out of an Atari, the borders are usable if you make a new display list. So you can get another, 48 lines I think (I am not totally sure, been a long time since I've done it). The first in the Display List are 112, 112, 112, which gives 3*8 lines, so I do think it's about the same on the lower border, but it could be a little less. Take Atarian care and have an Atarian day

> the 1541 still spinning.... One strong point: the 1541 makes no noise...

I suppose you haven't got a clue, what a fast-format routine is..
A C-64 formats a disc in approx. 10 seconds with a fairly good format-
routine. (and i'm not talking about just cleaning the directory).
Ok.. it won't be able to run asecond program during that fast-format-
operation, but if you manage to play one level of Gem Drop in that
time, I suppose your game is whether a bit simple or you are Superman.

JTS never had any intention of doing anything with Atari. The deal was
they got $50m from the Tramiels and that was all they wanted. The fact
that Atari came with it was of no interest to them.

Did anyone really believe otherwise?

March Auction - Update 12

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, March 16 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

>>does anyone know of a site that has the schematic for the XEGS, I would rather
>>not have to buy it just to track does were pin 16 on the 6520 goes. The trace
>>goes under the chip and out the end along with 6 other traces. If not I
>>guessI could get my meter out of storage but finding it could take forever.
>
>I don't have a site, but I do have the schematics. At home. I'll look it up for you.
>
>BTW ABBUC (search for them in Michael Currents FAQ or on the InterNet) sells them for
>DM5 (about 2.5 dollars, p&p NOT included, but it's 3 or 4 pages size A3 (the siye of
>two sheets (the size most of us use for their snail mail) of paper and a big envelope.
>
>CU Mathy Van Nisselroy

pin 16 of the PIA (PB6) goes to the MMU pin 13. Pin 13 used to be connected to
Chips select of the BASIC ROM (it was an output, now it's an input). Pin 14
of the MMU used to be connected to MPD (Math Pack Disable) on the PBI. It's now connected
to A13 of the OS/BASIC/Missile Command ROM. I haven't quite figured out if this
also turns an input into an output. That would be bad, cause then you can not add a PBI
to the XEGS. Something else that's new is that pin T2 (forgot to write down the number)
of the GTIA is now use as Keyboard detect. On the 600XL, 800XL and 130XE it was not used.

The schematics the ABBUC sells contain: Schematics (motherboard)
Schematics of keyboard circuit
Silk print (roadmap to the chips and stuff)

CU Mathy Van Nisselroy

2730. Re: Chroma/Luminence on XEGS

Newsgroup: comp.sys.atari.8bit

>Does the XEGS have chroma/luminence output?

>Andrew Lee

Nope, not standard anyway and I haven't heard of an upgrade/mod yet.
It has two RCA jacks, comp. video and audio. That's it.

CU Mathy Van Nisselroy

>well,,,, it is a pretty big board. lots of ICs. uses a CRT9007
>controller chip for video. looks like 4K of screen memory. an EPROM.
>looks like it plugs into the second PBI socket on the MIO, so it may
>even work as a stand-alone device!
>
>
>Bob

Could you PLEEEEEEEEEEEEAAAAAAAAAAAAAAAAASSSSSSSSSSSSSSSEEEEEEEEEEE
try that (using it as a stand alone)?

How good is it? How many colors? If it doesn't work as a stand alone,
how hard/easy would it be to make it work as a stand alone? Is it BlackBox compatible?
Can it be reproduced? For how much? Oh, I can smell the soldering iron already!! :-)

CU Mathy Van Nisselroy

PS could somebody write us a GIF (or maybe even a JPEG) viewer for this one? :-)))

2732. Re: 600XL:16K to 64K Upgrade

>
It's possible to upgrade a 600XL to 256K. But it aint as easy as 64k.

CU Mathy Van Nisselroy

PS hey Bob W. didn't I send you the text to this in that box I send you
right after you took over Atari Classics.

It's available. Just don't know where. You might try the CSS BBS. If
I remember to do so next week, I'll see if I can find a way to send it to ye.
But I'm still puzzle by these darn PC's.

Mine has a label (yellowish brown or brownish yellow). It even says LEFT on the top (as in Left cart slot). It was one of my first games and I've played it a lot. Graphics are not very good, sound is ..... (pooof, peeew). A real shoot them up if ever there was one. I LOVE IT.

Did Hasbro buy Atari's patents? I read the sea doc several times and I don't
think they did.

>
> 2) Hasbro is only interested in the game franchises so that they can make

This I think is most likely. I would like to add that I can easily imagine
Hasbro Interactive changing its name to Atari.

As interesting as those three are, I think Hasbro marketing a Project X or M2
based console under the Atari name much more likely. Lets be honest, even an
upgraded Jag will not have the kick butt hardware needed to compete with
Project X and Sega's next system. As for the Handheld, I don't want to
believe it but i've been thinking. Isn't odd that Nintendo now annouces a new
color game boy (but no release date)? Nintendo had to know before we did.
Game.com was the only serious chalange to Game boy for years, improving its
technology with the purchase of another company should have been something
they were looking out for.

>
> Fantasy: (In order of what I'd most wish for)

No way. They may become a software maker and maybe a video game hardware maker but I don't think anyone sane would chalange the PC market.

The best case fantasy for me would be: Hasbro Interactive and Tiger Electronics devisions would become Atari under Hasbro. The new Atari would sell software for computer and video game systems, sell the popular cheap LCD games, and release a game system based on Project X.

2738. 8bit Atari board for the PC

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-13 00:00:00 UTC
From: chris <NOSPAMroom101@NOSPAMix.netcom.com>
Message-ID: <6ebdup$2oa@sjx-ixn2.ix.netcom.com>
Source record: 64757

I recently saw an product from Diamond Computer (wonder if they became Diamond Multimedia), offered back in the late 80s, that plugged in your PC's 8bit ISA slot and was a fully functional Apple IIe computer! Used the IBM as a disk, hard disk, keyboard. You could hook up an external Apple drive for true compatibility and a composite monitor could be used simultaneously with the PC's video. Pretty neat. That thing was crammed with DIPs! Had a 6502 and a Z80 (for CPM I guess).

Got me thinking, why not develop a similar plug in card for the Atari 8bit? When you can obtain a 600 or 800xl for $10, why not gut it and use the nicely socketed ICs for this project. Has anyone else entertained such an idea?

You know it's been so long since I tried it, I can't even remember much
about it other than I preferred the 40 columns, so I stayed with that.
I think I still have that MIO, so maybe when I get some time, I'll try
to dig it up.

BOB WOOLEY (sp?).!
Yes, Say Bob, or Steve Tucker, or Bob Klass or any of you
hardware hackers. I've got a 256k MIO. And I don't know
what I'm doing, but that never stopped me before (I got
married when I was 19, still married to the same lady,
35 years later)
Anyways I have my 256k MIO, which works and Martin's
256k MIO, which doesn't. I'm poking around with a
logic probe, volt/ohm meter. I have an old oscilloscope,
but I don't know what to look for.
Here's the extent of my thinking. The defective MIO
has 'bad' signals, everywhere. My good MIO gives nice
pulses all over. So, this leads me to believe something
around the fundamental clock circuit isn't functioning.
It ain't beating a tune. Also, the bad MIO drawas
draws about 16% more current. I busted a little cap
that takes ac off the crystal to ground, so I gotta
go out and get a new little capacitor. Say, would
somebody write a 'howto' on fixing computer electronics?
What do I look for? I checked the power supply part.
I disconnected the main power from a 3 pin rectifier
and it gave me a nice 5v, all pretty. When I re-connect
that power pin, I get the 'buzy' high that the whole
board has.
Thanks

Actually JTS' primary interest in Atari was so they could go public without having to go public. By acquiring a company which had common stock available on the American Exchange, JTS was able to convert that stock to JTS stock (which had not existed at all before) and "go public" without having to go through the standard procedures of going public.

But yes, it's true that JTS never had any intention of doing anything worthwhile with Atari. I'm surprised it took them this long to sell it.

> the machine???

That should be 960 bytes for Gr. 0 not 9K. Once the characters are
copied into
screen memory the character set space doesn't impact the CPU processing.

Add to this, that no matter what graphics mode you pick, if you need the
speed
you can turn off Antic and then there is no impact at all.

Nope, there was nothing wrong about the way 3.60 handled that poke. But,
strangely enough, XL-It! and other emulators don't perform that function.

For $5000, one of us would have bought it ;-)

You forgot to add a few zero's to that figure. The Atari name definately
has some worth left in it. Hopefully with the renewed interest in
classic
gaming, Hasbro will capitalize on this. We'll see what happens though...

You could try reheating all of the solder joints on the PCBWave
soldering (like used to produce the MIO) eventually
begins to disintegrate and can cause all sorts of unusual problems

> Which leads me to....
>

So Hasbro now owns Tiger, Atari and Colecovision.....

Given that Tiger aquired the rights to the Apple][, that means Hasbro now
owns the rights to the:

Colecovision, Atari 2600, Atari 5200, Atari 7800, Atari Lynx and Jaguar
consoles

plus the:

Apple II/+/e/c/gs, Adam, Atari 400/800/XL/XE/GS, Atari ST and Falcon
computers

Hmmm,

perhaps someone at Hasbro is a classic computer/console enthusiast with
pots of money to spend - is the shell of Commodore next on thier shopping
list?? :)

On a more serious note, I don't know much about Hasbro - do they have the
financial resources to take on Sega and Nintendo if they wanted to??

Graham.

Not that this will help much, but it might make you feel better...

I felt that this situation ((re: Terry Ortman/ Starfleet software)
which has gone on for years) was, and is a definate slap in the
face to Star Trek. I sent E-Mail to Majel Roddenburry asking
them for help. I got a phone call from one of Paramounts reps
just a few minutes ago asking me for more information.
It looks like they are now looking into his activities.

It won't get you your money back but....

lets wait and see....

I didn't want to offend you buddy, thus you do not need to feel like I did. I truly think that C64 and Atari are two very nice systems. What I miss on the C64 is the amount of colors that your Atari has. My reasons these days for not buying an Atari simply was that there was too less Software and Bookware available. Anyway, if I had had an Atari and the right contacts these days I'd probably be on your side now. Mut anyway there are a few Quastion that I have about Ataris like the 800Xl. How was the Sound (honestly) compared to C64? Did the Atari have Sprites, or what are the main reasons why you prefer Atari to C64? Just history, or are there some things in the Atari-Design that you consider as being very good?

Yeah, I like that hack too. I was thinking however, of a nice
all-inclusive, dust protected, environment. I know... it's benefits would
be marginal over that of the SIO2PC, but sometimes you just want to climb a
mountain because it's there.

There is a setting in the original controller, an NEC uPD 765, for MF
(or FM if low), with a corresponding output pin ton control the data
seperator circuitry approriately. UNfortunately, the print for the
board has no provision for changing the data seperator, and the MF pin
designed for this function is NC .. not connected. In addition, as I
recall, there is no provision for 128 byte sectors (but I cannot find
the reference book, so my memory could be foggy). I also vaugely recall
that the Intel replacement for the NEC chip did away with the MF/FM bit
altogether.

|> nicely socketed ICs for this project. Has anyone else entertained such an
|> idea?

Chuck Steinman (Dataque) floated this idea a couple of years ago, and
received a less-than-stellar response to it. IIRC, the big drawback was
the price - it seems to me he was looking at charging something in the
$100-$150 range in order to recoup costs. Most responses were along one
of two lines - (a) I can buy a used XL off the net for $20-$30, why would I
want to spend $150 for a card, or (b) why would I spend $150 for a PC card
when I could run an emulator, perhaps slower and less robust, for little
to no cost on the same box.

I think you've answered your own question in your second paragraph:
"obtain a 600 or 800XL for $10". I think only the die-hard afficiandos are
the only ones who would be willing to spend that kind of money on a PC card.
And there may just not be enough of us around.

I'd like to know what Chuck's up to now. I sent email to him a coouple of
months ago but never received a response. He's developed and sold a number
of nifty devices over the years.

Source record: 64779

Hi all,
while scanning and proofreading the "Mapping The Atari" I noticed the
following:

GTIA - it stands for George's Television Interface Adapter.

Is this true?
The author didn't know where CTIA stands for btw.
I would like to know what the acronym really stands for.
Anyone an idea?

By the way, does anyone knows if there were Atari's released
which supported SECAM (besides PAL and NTSC that is)?

And if you still have Public Domain and/or Freeware for the Atari
(being it XL/XE programs or PC/MAC utilities related to the Atari),
they can still make it to the POOLDISK II CD-ROMs.
Send the material (old Atari adds/video's/scans are welcome too!) to:

ernest@wxs.nl

Regards,
Bo.

2761. A1010 cassette drive questions

I'm trying to use an A1010 cassette drive to play audio tapes as
part of a much larger, much cooler future project. Anyone here
know how to do this? Ie, do I need to pass special commands to the
drive, or can I just tie some SIO pins high/low and get it work?
Also, on which pin would the audio signal appear?

Any info is appreciated...
-Chris

The biggest key is to realize how much energy consumption affects your
final score, and that your shields use up a lot of energy. In other
words, you have to keep your shields off almost all the time, except when
you're in immediate danger of being blown to bits!

And you have to play Commander level, and you can't let any starbase be
destroyed...

I have a specific problem, right now, with fixing (?) this
busted MIO. I broke a little capacitor, must replace it.
It is a small 'glob' capacitor, on the bottom of the board.
It connect(ed) one pin of the big crystal to ground (went
accross there), is in parallel with a trace to a pin
on the 6551 or 65C51 LSI (pin 6, I think). Anyways, the
one I busted was marked with a 220. The one on my good
MIO is marked 22k. What picofarad is that? I'm guessing
22 picofarads, less than 50 v. would be a correct
replacement. This is very specific question.

Think about it, guys. Didn't Project X's Jeff Minter state they had the backing of a MAJOR company at some point? Who's to say that major company wasn't HASBRO? If you think like I do, then I think you can start to see some sort of correlation here.

1) Project X is created by a bunch of former Atari Employees and aficiandos.

2) Project X becomes a rality, but is still secret, teasing us with the line: "We have the backing of a MAJOR corporation..." And, they're waiting for the right time to release it.

3) HASBRO buys Atari for $5,000,000. Hasbro is a huge company.

4) Hasbro now has the Atari name, products, trademarks, et al.

Theoretically, Hasbro could be that huge company Project X is signing onto, and they were working between Project X and JTS to get the name and the products so these former employees could use the Atari name on their new Project X. Granted, Atari isn't exactly an unsoiled name in the industry after the Tramiels got done with it, but if Hasbro and Project X can work this properly, I think it'd be a valid shot. This is also considering Hasbro would have the money to do an all-out advertising campaign, comparable to those of Sony and Nintendo. Enter the Lynx. The Lynx never had the following it could have had, and, being a color handheld with more power than any other, Hasbro has the library of games as well as the technology and advertising capability to really kick the Lynx's ass back into the ring. Also, third-party developers would be more inclined to develop for a well-advertised system, because it lowers the possibility of taking a loss on the venture. And...if Hasbro played their cards right, the Atari Jaguar could be resurrected as a 'low-cost gaming alternative' to the current array of systems. Open up the market for public-domain development materials on a larger-scale. It's a marketting idea for geeks, I know, but it'd reap rewards as being educational AND fun. And just think of all the developers that never gave the Jaguar a chance but could really get their name out on a larger scale if the Jaguar was indeed advertised and its games would get published on a regular basis? With a two-tiered philosophy (low-cost vs. premium) including Tiger Electronic's Game.com (low cost), Lynx (premium), Jaguar (low-cost), and the almighty Project X (premium), there's no doubt that they'd reap rewards off such a deal. The right time is now, people.

If this is some sort of underlying conspiracy, let the conspiracy begin!

The sound in the Atari was very good we have 4 channels of 8 bit res, and
option for 2 channels of 16 bit, we also have lots of filters and other
goodies, we have Sprites, but Atari call them Players, 4 of them and 5
sprites, and about why i think the A8 is better: Interrupts, we can handle
VBI, 60Hz int in NTSC, 50Hz in PAL, DLI's, 15750Hz int for NTSC, we have 17
graphics modes, a display list, so you can mix graphics modes, scrolling
with just 2 bytes handling, no need to boot with basic on, 256 colors
displayable at the same time etc, etc, etc. Really we don't have time to
describe all the goodies in an A8.......

Greetings from Mexico

I must be getting brave lately since I did the same thing! I got
EXACTLY
the same response! (right down to the "righta" instead of "rights")
I later realized that Hasbro is the parent company to Hasbro Interactive

and then I contacted their PR person (Yes I know about the reliability
reputation of the PR people) but so far no answer! (nearly 2 days)
That in itself says something.....

Pat.

2771. Cheap to a good home

From: Eric Gunnerson <ericgu@micronospamsoft.com>
Message-ID: <6ecmhj$unk@news.microsoft.com>
Source record: 64790

As part of my spring cleaning, I've decided to get rid of my old Atari system. It's now 3rd down in the computer pecking order, and I haven't turned it on in a couple of years. Included are:

Atari 800XL Computer
Indus GT disk drive
Audio out patch cord

Cartridges:
Star Raiders, Bounty Bob, Miner 2049er, plus a few more

Lots of software (carts & other) on disks (don't flame me, came from a friend when she sold her system).

I'd like to sell it as a package to make things easier. I'm in the Seattle area, and I could ship if you want to pay for it.

Make me an offer.

Aaron Christopher Finney (aaron@orr.wfi-inc.com) wrote:
: I know, I know. Another idiot who can't use his 850....

: Well, I made the serial cable for it with the pinouts in the faq and
: the cable tests out dandy with an ohmeter. Using 850 express or IceT,
: I can control the modem (i.e. send the at commands for off-hook, reset,
: etc) but nothing seems to be coming in. I can connect to remote hosts
: and the rx/tx lights flash like demons, but nothing on the screen at
: all. The modem is a newer Practical Peripherals v.34 crapper.

: Thanks in advance,

: Aaron

You can test the transmit/receive capability of each port on an 850 (not handshaking) as follows. Jumper pins 3 & 4 of the port you want to test. Turn off all peripherals, drives, and the computer. Turn on the 850. Turn on the computer with BASIC. Type in the following program from 850 service manual and RUN it.

```
10 DIM IN$(30),OK$(30)
20 BAUD = 1:REM Make BAUD 0 - 15, see table
30 XIO 36,#2,BAUD,0,"Rn:":REM n is for port 1 - 4
40 OPEN #2,13,0,"Rn:"
50 XIO 40,2,0,0,"Rn:"
60 INPUT IN$
70 ? #2;IN$:REM Output IN$ through port
80 INPUT #2,OK$:REM Input IN$ through port & rename it OK$
90 ? OK$
95 CLOSE #2
99 END
```

```
BAUD RATE (bps)
---- ----------

0 300
1 45.5
2 50
3 56.875
4 75
5 110
6 134.5
7 150
8 300
9 600
10 1200
```

11 1800
12 2400
13 4800
14 9600
15 9600

A good 850 should correctly echo to the screen whatever you type in (after pressing RETURN) at different baud rates. The unit I have makes a few errors at 9600 baud but still works ok through a modem at that speed.

Cr> http://www.cs.dartmouth.edu/~crow/atari/

Isn't it funny how different minds can come up with the same sort of program?
My program is written in Turbo Assembler 5.0 and is designed for DOS use.
But people with C experience and Unix machines now have the availabity of
such a tool too now. Nice.
As long as it deals with Atari, it is always nice... :)

Dk> of. I just don't do Windows!
Dk> (and I don't know anyone who does)

CD-rom is actually THE media to use at this moment.
You can store up to 640 of data on it.
How do you want to distribute it then?
On 1.44 MB diskettes? You need a pc as well.
On 5.1/4 " diskettes then? You need a lot of them!
Zip drives? This could be done, since the Blacb Box
can handle ZIP drives. Then again, you still need 6 media
and a BB.
So, to put it basically, how do YOU want it?
Tell me, maybe we can do it...
Bo.

Hi Atarians!
Just wanted to let you all know that I've just released a NEW version
of the PC's Atari Disk Image directory lister and extractor XDIR.
The current version is now release 06.00.00.
Still freeware of course.
The new version has been totally redesigned, and the user interface
is a little bit more intuitive (at least I think it is).
This version supports Windows 95 as well now. It also runs under DOS
by the way.
Let me know what you think about it.

You can download XDIR v6 from: HTTP://WWW.XS4ALL.NL/~STACK/ATARIXLE.HTML
Email can be send to: STACK@XS4ALL.NL

Enjoy it,
Bo.

dklugh@iwaynet.net wrote:

: My 1050 Duplicator drive runs at 290-291 RPM and it can read all my disks.
: My Trak drive runs at around 281 RPM and it's even worse.
: Is it just my drive speed or should my drives not be having any trouble?

: And how do I adjust the drive speed?

: Net-Tamer V 1.10.1 - Test Drive

The 1050 service manual says the speed should be 288 RPM +/-3%. There's
an adjustment pot inside the case, near the back of the circuit board on
the left. It's VR2. Utilities have been written to measure spindle speed
in RPM or milliseconds.

The Lynx is probably one of the primary reasons for the purchase. It's not really outdated when you compare it to the LameBoy.

You all might want to check out Jaguar Interactive II. There's someone there (who I believe is from Hasbro) posting much information on this deal. The Lynx is definitely part of it too...

Thanks for the heads up on BG... good outfit. Some confusion over the chips I'm looking for. Consulted the FAQ Tech docs on the upgrade. It's the 4464 that is required, not the 4164. If I am not mistaken, the 4164 is a 1x64k chip, whereas the 4464 is a 4x64k. This would explain why 1 4464 is $2.70, whereas 9 4164 are $3.50. They sure make it easy! Thanks for the source, however.

Atari is dead. It died when JTS merged with it. The question is, will
a new company called Atari, with the spirt of old, will come into
being. The worse thing that will happen is that the Atari name and
some old Atari games will come out in new updated software titles.
Hasbro isn't a stupid little company.

> replacement. This is very specific question.

Arent capacitor markings fun? :) Your lucky its marked at all.

Most small ceramic (im assuming here) caps are marked in pf w/ the number
if extra zeros being the last number.

220 = 22pf

That's exaclty what i think. Nobody spends $5Mio Dollar for nothing.
I hope they are firm enough to use the technical base!

Regards, Robert

Atari isn't death. 'Atari' dies with the last user ...
We are the family :)

Face facts people. The Lynx, Jaguar, and ST were all better than their
competition, yet all bombed. I got burnt a number of times by buying
Atari. Don't get your hopes up for a new and improved anything with
the Atari name.

I'm looking to buy an Atari 130XE system with disk drive. System and disk drive must be in good shape. Please mail me if you have a system to sell.

Thanks in advance.

> Hasbro isn't a stupid little company.

The problem with everyone's speculations as to whether or not "Atari" can rise from the ashes is...public perception. I spent 13 years as a video game/computer software store manager. Up until a year and 1/2 ago. Problem is that right now the public, by and large, perceive the company called "Atari" (and they DON'T know the difference between Midway's Atari and Hasbro's Atari!) is for the most part a has-been company. An outfit that makes sucky products that are now being cleared out for $50 per console at a toy store chain. A company that used to be cool, but can no longer cut the mustard.

Obviously, NOT MY OPINION. But, realistically, the opinion of the vast majority of folks who spend $$$$$'s out there, and aren't "in the know". Mention Atari to anyone who owns a PSX or N64, and they start talking about the VCS they have in their attic. They would not dream that you could be talking about anything after that!

Obviously, for the name "ATARI" to become a powerhouse name once more, it will take more than a cook, killer console. It will take lots of well-done PR, probably in "stealth" mode (the public can't be aware that they're trying to have their hearts won back over to the name once more). Part of me thinks it will be much, MUCH easier to turn a new, different name into a powerhouse than it will be to find a way to rehabilitate the public's opinion's of an outfit called "Atari".

No, Hasbro will do much better pushing the trademarks of the GAMES that have names that folks fondly remember: Centipede, Warlords, Asteroids, etc. Even Yar's Revenge (which started life as a Star Castle home version) is still held in high regard with many folks going down memory lane. New versions or collections with these have a much better chance of making back the 5 mill that Hasbro spent, IMHO. Unless the public starts getting tired of the new 90's versions of old games. How far can that go, exactly?

DAVE

: Memory locations wise? Sheesh, its been way too long ago for me, but
I'd
: be happy to try digging for them.

Purely from memory, I believe this one is "POKE 53774,1". I unfortunately
do not have access to an Atari 8-bit to try this one out. It's amazing
what things etch themselves into long-term memory (I just hope mine's
accurate!).

March Auction - Update 13

Auction Rules:

-In case of ties, the first bid received is the bid accepted.

-Auction will continue through Monday, March 16 10:00pm central time. After that date, bidding will continue on any items which have received a bid within the last 24 hours. Anyone may bid on an item that is still receiving bids. Minimum bid increment may be increased after the auction deadline.

At the deadline, items will be marked sold immediately if they had no bids in the last 24 hours. For
example, a cartridge that received a bid at the beginning of the action will be marked sold at the deadline
unless a higher bid is received within 24 hours before the deadline.

-Not accepting trades at this time.

-If you bid, you are expected to buy. Payment is by check or money order in U.S. Funds. No CODs. Allow 10 business days for checks to clear.

-If you have a U.S. address (except Alaska or Hawaii), total shipping and handling is $3.95 for any number of cartridges or manuals; $6.95 if package includes systems, modules, hardware, or more than 2 books. Shipping for packages with magazines: $3.95/up to 3, $4.95/4, $5.95/5, $6.95/6 or more. I'll pay any difference. Some items require actual or additional shipping, if stated.

-Place a bid by item number and description. Your first bid must include your name, address, and phone.
If you would like to remain anonymous, please include a substitute name with each bid.

-Minimum starting bids are listed. Minimum bid increment is .50 on items under $3, $1 on items $3-
$9.99, $2 for items $10-29.99, and $5 for all others.

-Instructions and box are only included if stated. New in box is new, but not necessarily sealed. Complete
in box contains instructions and is used.

-Send all bids to ClAuction@aol.com.

Sorry for lateness, behind on CSA8.

Yes, what we really need to make an A8 browser a reality is
mainly a TCP/IP stack (from the C64 code?) and an HTML
interpreter. The web page creators out there for all other
machines are 9/10 a browser. All that is missing is the TCP/IP
access to the net. IF we could just get to the point where we have
an A8 versionon of LYNX running, we wouldn't have to rely on
servers that allow LYNX access. Face it, someday we won't be
able to use a public LYNX client. Some bonehead will remove it,
thinking that it is taking up space and no one is using it.
Once we have LYNX, then we can add capability to it. But we
need a foundation on which to build. The Amiga and ST each
have a version of LYNX (ALynx for the AMiga, and a version
for Mint for the ST) along with their other myriad browsers.
IF not LYNX per se, than another text-only browser that can
be added to (graphics, different fonts, sound, etc.).

Don't tell me that Hasbro is going to reintroduce the Jag console in it
current technelogical form considering that the Playstation kicks it and now
is in it's last legs of the product life cycle.

What really gets me is they seem to have paid $5 million for $45 million in Atari debt (and of course, the technology). They _really_ paid $50 million for the assets. They are obviously planning to do something real with it, simply suing for patent and copyright infringement and selling licensing won't generate that kind of revenue.

Secondly, I am puzzled by the omission of the TT in the hardware listing. I gues they just hit on the biggies (though I would think there are more TTs than Falcons), or is the TT an "ST".

I'm _still_ glad I sold the stock as soon as I came back up to break-even. JTS isn't looking too healthy is it?

I doubt Lynx will be going away anywhere soon. It is very fast (no grafx
to load) and also used heavily in University libraries.. especially where
Pentium powerhouses aren't available... I sometimes choose Lynx over a
graphics browser simply because of speed, and it is easier to get a
textonly library terminal than a Pentium at my University...

I owned the lo-res version of CrossFire as well (the 8k cart) It was
brown-black cart if I remember correctly and it did say CROSSFIRE on it.
It had a weird case, could barely fit into the Atari 400 cart slot.
i used to have so many 8bit ROms. I sold off more than half of them, now
i want to collect/trade more than I sell.. awell.. isn't that always the
case.. after you sell something you want it back.. :)

Reads to be a nice machine, i'm sorry for the atari-comunity, that
their market wasn't that good as it was for C64.
Atari always showed that they had a very shitty marketing. Sad but
true. Anyway. it still interests me.. what processor is inside an
At800 ?? I remember that the CPC had a Z80/Z81 inside. Was a cool
machine too, but I only remember basic coding on it.
I played a few games on an Atari (was there a 420 ??). I remember they
looked very shitty, but the first C64 games had a bad look too.
Think with a good programming there would be great games possible on
an At800. Has anyone ever tried to convert e.g. C-64 hits like
Turrican 2 to it?

But Tim - was the 'product' not a roaring success - in my view these fine products failed to attract a very large market share solely due to the lack of 'marketing' - most people never even heard of 'Atari' other than for the older games machines that were well promoted in their time.

When the 'Trammels' got involved in their money laundering operation (at least that's how it seemed) they made absolutely no attempt to 'market' the product - which - upgraded a bit for the times - could be successfully marketed today.

Or am I reading it wrong ???

Of course not. The Jaguar is a dead parrot. However it appear that Atari, the
name and the ideal, will get yet another chance. Its possible that the Lynx
may get a make over or that a cip or two from the Jaguar may get used in
something but don't get your hopes up. I'm hoping for an updated Yars
Revenge. :)

>licensing won't generate that kind of revenue.
>
Well first they bought Tiger Electronics not Atari? Why would they buy
both unless they had something planned, would be too much a waste of
money. Game.com is not moving on shelves too well. Perhaps they want to
do something in the way of video games but need a largely remembered
name like Atari. Suing for patent and copyright infingement could get
you good money depending on who or what is involvled. If it is simply
Jon Doe's Video Game Inc infinged on the patent of a design of
something totally meaningless by todays standard, you wouldnt get much,
but if it was Nintendo, Sony or Sega you could fetch more (Atari did
once already on Sega) especially if it had to do with something in the
Playstation console itself that couldnt be changed they could claim
damages millions and maybe make quite a bit of money.

These are presented more or less without comment. I have tried to
summarize what I believe to be the _relevant_ facts and features regarding
each computer.

Please feel free to email me comments or corrections (sjudd @ nwu . edu).

Atari
-----

Processor: 6502/6502C @ 1.79 MHz (see note 1 in Graphics/Misc section, below)

Graphics:

o Colors: There are 16 colors (hues) and 8 brightness (luminance) levels
available. There are nine color registers: four regs for
player/missiles, four regular color regs, and one background
color reg. These registers control all colors displayed on screen.

o Graphics modes -- 13 modes, most of which are useless (or rarely used).
From the FAQ:

ANTIC AND THE DISPLAY LIST:
ANTIC CIO/BASIC Display Resolution Number of
Mode # Graphics # Type (full screen) Colors
-------------------------------------------------------------
2 0 Char 40 x 24 1 *
```

```
3 - Char 40 x 19 1 *
4 12 ++ Char 40 x 24 5
5 13 ++ Char 40 x 12 5
6 1 Char 20 x 24 5
7 2 Char 20 x 12 5
8 3 Map 40 x 24 4
9 4 Map 80 x 48 2
A 5 Map 80 x 48 4
B 6 Map 160 x 96 2
C 14 ++ Map 160 x 192 2
D 7 Map 160 x 96 4
E 15 ++ Map 160 x 192 4
F 8 Map 320 x 192 1 *

+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.
```

A short explanation is required: In "Char" modes an 8x8 character set is used but displayed in different ways. For example, mode 5 displays characters at double-height, mode 6 at double-width, mode 3 uses "8x10 pixels", etc. Colors are fetched from the color registers.

Graphics modes of course use individual bits to control regions of screen pixels.

Note that display lists are used to generate graphics; see Miscellaneous section, below.

o Custom characters
128 8x8 custom chars are available; chars with high bit set are displayed in reverse-video.

o Sprites
Ataris have "player-missiles", like the 2600. There are five "players" available. Each player is 8 pixels wide, and is either 128 or 256 lines tall. The horizontal position is controlled by a register; the vertical position is changed by manually moving the bitmap data in memory (each player is a column of a graphics screen).

The fifth player may be split into four "missiles", 2-bits wide each, where each missile has its own horizontal position reg.

The width and height of the pm resolution may be changed (double the pixel width on the screen, quintuple the pixel height, etc.).

There are four different priority schemes; two players may be
combined to form a multicolor player (overlap generates third
color); all missiles are the same color; can detect collisions
with other players and with screen (collisions are indicated
in a register).

o Miscellaneous
- ANTIC display lists. Three instructions are available:
display blank lines (1-8 lines), jump (jump and display
one blank line, jump and wait on VBI), display line of
graphics (plus h/v scroll, generate display list interrupt,
and load new scan counter, i.e. change where graphics data
is located).

Display lists are used to generate the display: to blank
the borders, to tell the chip what resolution to display the
next line in, to generate scanline interrupts, etc. Each
line of graphics is controlled by some instruction.

- Overscan is possible.

- Scrolling is done via a combination of the display list and
scroll-position regs. Vertical scroll reg is 0-7 lines,
horizontal scrolling is more complicated, and scrolls double
the number of pixels (2 pixels instead of one).

Note 1: ANTIC halts the CPU for DMA to read instructions, graphics
data, etc.; so e.g. DMA occurs on every scanline in 320x192 mode.

Sound:

- Four audio channels, 8-bit frequency register (about 3 octaves),
square-wave.
- Channels may be combined to form two 16-bit frequency channels.
- Noise waveform is available.
- Frequency clock may be 64KHz or 1.79 MHz.
- High-pass filter for channels 1 and 2, as clocked by channels
3 and 4 respectively.

Timers/Interrupt Sources:

o Keyboard: Keypresses generate an IRQ
System Reset generates NMI

o Serial input, serial output may generate IRQ

o POKEY audio timers. They are strange: see timers, below.

o ANTIC: Display list interrupts (DLI) generate an NMI
Vertical blank interrupts (VBI) generate an NMI

o Timers:
- "Real-time" clock and system timers done in software, using VBI

- POKEY's "audio timers" may generate an IRQ when they countdown
to zero. They are reset via a register write (any value).

Someone else will have to explain the details. I believe
they always count down from the same starting value, but have
never really understood how they work. (Any volunteers?)

Hardware I/O:

- Joystick ports
- Parallel bus interface: memory expansion, etc. (50 pins)
- Cartridge slot: ROM cartridges (games or DOS)
- SIO (Serial port): main I/O port; disk drives, printers,
modems, etc.

==========

Commodore 64:

CPU: 6510 @ 1MHz (see note in graphics/misc)

Graphics:

o Colors: There are 16 available colors. There are seven color registers
(border, 4 background, 2 multicolor sprite regs) and eight sprite
color registers (one for each sprite). Screen color is determined from
registers and from color RAM; each byte of color RAM determines colors
in every 8x8 section of the visible screen.

o Graphics modes: There are basically two color modes on the 64: normal
and multicolor. Multicolor mode uses two bits to control each pixel,
halving the horizontal resolution and making four color choices available.

In terms of graphics modes, there is character mode and there is
bitmap mode. Character mode displays 8x8 characters; bitmap mode
controls individual bits. Multicolor mode halves the resolution
in either case, as explained above. Character mode is 40x25 (characters
are 8x8 in hires and 4x8 in multicolor); bitmap mode is 320x200
(or 160x200 in multicolor mode).

The color in each 8x8 section of memory is determined from VIC
registers and from color information in RAM. For example, in
normal character mode the background color is taken from the
background color register, and the foreground color is taken
from color RAM. In hires-bitmap mode (320x200) both the foreground
and background color are taken from RAM. Thus different parts of
the screen may have different colors without modifying registers.

o Custom characters: There are 256 redefinable 8x8 characters.

o Sprites: All eight sprites on the 64 are essentially identical.
They are 24x21 pixels in size, and both their x- and y- positions
are determined by hardware registers (and may be off the visible
screen). Horizontal and vertical resolution may be doubled.
Multicolor mode halves the resolution, as described above, and
each sprite may independently be in hires or multicolor mode,

with colors determined from registers.

Sprite-to-foreground priority may be selected for each sprite;
sprites are enabled individually; sprite-to-sprite and sprite-to-
foreground collisions are indicated, and can generate an interrupt
(see Interrupts, below).

o Miscellaneous:
- Fine-scrolling of 0-7 pixels horizontally and vertically

- There is an extra graphics mode called "extended background
mode" which lets characters take extra background colors
(with foreground color still determined from color RAM);
64 characters available.

- VIC halts CPU for DMA access every 8th scanline to fetch data;
also halts to fetch sprite data; DMA can be forced to fetch new
data for each scanline.

- By changing registers, pointers, colors etc. on different
scanlines, different modes can be combined, more than 8 sprites
can be displayed, etc.

- Current raster scan line indicated in register.

Sound:

SID is the 64's sound chip. The designer, Bob Yannes, later founded
Ensoniq. There are three voices, and each voice is essentially the
same. The following are independently controllable for each voice:

- 16-bit frequency (>8 octaves)
- 12-bit pulse width for pulse waveform (square wave is special
case)
- Four waveforms available: triangle, sawtooth, pulse, noise
- Attack-decay-sustain-release volume envelope
- Synchronize oscillator with previous voice oscillator
- Ring modulate oscillator with previous voice

In addition, there are three filters: low-pass, high-pass, and band-pass.
Filters may be combined, and resonance (sharpen the filtering) is
selectable. Each voice may be passed independently through the filters.

Finally, the upper eight bits of the voice 3 envelope and waveform
is readable (e.g. used to generate random numbers, to modulate
voices, etc.).

Timers/Interrupts
----

o Timers: A software timer is maintained by the system, but the important
timers are contained on the CIAs:
- There are two CIA chips in the 64. The CIAs perform all
major I/O, and each has two 16-bit timers on board; the

two timers may be effectively combined into one 32-bit
timer.
- The current timer value may be read as well as selected.
- Timers may count down continuously or once (one-shot).
- Timers may count processor cycles (1MHz) or external signals.
- Time Of Day (TOD) clock counts hours,minutes,seconds,tenths

o Interrupts:

Keyboard: generates an NMI when RESTORE key is pressed

CIA #1: There are five selectable IRQ sources:
- timer A counts to 0
- timer B counts to 0
- TOD clock reaches alarm time
- Serial shift register
- FLAG line (connected to casette port)

CIA #2: Similar to #1, but generates NMIs instead of IRQs,
and FLAG is connected to the user port.

VIC: There are four selectable IRQ sources:
- Raster compare (set an IRQ to occur on specific raster line)
- Sprite-to-background collision
- Sprite-to-sprite collision
- Light pen trigger.

Hardware I/O

In addition to the joystick ports, there are:

- Serial port (disk drives, printers)

- User port (44 pin) -- controllers, modems, hardware projects

- Expansion port (24-pin) -- ROM cartridges, expansion devices
(UART+modem, accelerators, etc.)

Finally, my personal opinion: the Atari has some nice specific features, and
is a very capable machine; the C64 is much more balanced and versatile,
more accessible, and significantly more powerful overall.

All done :)

The only way they could make any money with Jaguar anymore would be to get the Jag/Jag CD combo out at well under $100. That way they could attract some 3rd party developers to the CD, but IMO it is too late in the current generation to make enough that way, especially now that the Saturn will be officially canned at the end of the month. Another problem is power, the Jaguar is supposedly more powerful than Saturn (the Jag CD supposedly allows optimum access to this power) but is still is not at the level of Playstation in 3D. It probably could turn out convincing 2D platformers and 2D fighters though. I think a Project X liscense would be a better bet for the Atari name.

2814. MyDOS versions and AUTORUN.SYS

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-14 00:00:00 UTC
From: crow@coos.dartmouth.edu
Message-ID: <6eeuoojue1@dartvax.dartmouth.edu>

I just noticed that MyDOS 4.53/4 doesn't run AUTORUN.SYS when it boots. 4.50 did. Comparing the files, it looks like the newer version runs '*AR0' instead. Indeed, renaming AUTORUN.SYS to AUTORUN.AR0 did make it load automatically.

Does anyone know why this change was made?

I'm also curious as to any other changes between the two versions (or other versions that are popular).

Message-ID: <slrn6gmb50.21g.aaron@lafleur.wfi-inc.com>
Source record: 64824

Everything working now, thanks to everyone. I typed in that little basic program from the manual and ports 2-4 worked fine, but one just locked up the machine. I pulled the chips for 1 & 2 out of the sockets and switched them around and wasn't surprised to find port one working just fine. What did surprise me, just a little bit, is that both ports work now.

Now to set up a shell account....

my MIOs do not have such a thing.... but, the capacitors value is two
digits and a multiplier.... so, 220 is 22 times 10 to the zero. 22pf.
the 22K is also 22 pf, I expect.
the scientific way of doing this is to just get both sizes - a 22 pf and
a 220pf.
one of my secrets!!

Nah. Considering how desperate JTS is for cash, they could have gotten
the license for said technology much cheaper.

>
> 2) Hasbro is only interested in the game franchises so that they can make
> games for other systems using Atari owned characters and lisences.

This sounds very likely. Regardless of what else Hasbro may do with the
Atari properties, I am quite sure we'll see this.

>
> 3) Hasbro wants to enter the handheld game market and plans to rerelease
> the Lynx.

This also sounds possible to me. Purchasing Tiger shows they have an
interest in the handheld market, and perhaps even gives them a plant or
two to manufacture the Lynx in. Perhaps even the ability to fabricate
their own LCD screens? Should bring down manufacturing costs
considerably!

Wouldn't a faster, higher-resolution Lynx be cool? Woo-hoo! (Imagine a
Lynx with a 320x200 screen, running at double the clock speed, with 3D
support in hardware, and a built-in [or bundled] TV tuner, all for only
$99. I like it!)

But man, I really hope they don't try to sell it as the Tiger Lynx!
Yuck.

>
> 4) Hasbro wants to enter the home console market and plans to rerelease
> the Jaguar as a "budget" home video game console for around $50.

No way, they couldn't manufacture the Jaguar chep enough to really meet
this price point. And the Jaguar's dated technology and poor reputation
would really be unable to compete against the strong current market
share of the PSX and N64. I love my Jaguar, but I'm afaid it is too dead
for this.

>
> 5) Hasbro wants to enter the home console market and plans to release
> an upgraded Jaguar to compete against the N-64 and PS.

Well, the Jaguar II design (AKA Project Midsummer) was completed, and
was supposedly quite powerful. I believe the hardware could compete if
they came up with some good software for it. But I would sooner bet that
Hasbro is a Project X licensee then say they intend to revive the
Midsummer architecture.

>
> Fantasy: (In order of what I'd most wish for)

Any notion of Hasbro putting the Atari logo on a piece of hardware
pretty much goes hand-in-hand with this one!

>
> 2) Hasbro wants to make a very cheap hand held game machine. What they

> for under $30.

Never happen. And personally, I'd rather see the Lynx come back. Though
it would be cool to see a 2600/7800 emulator for the Lynx. You could
easily cram a couple dozen games on a single Lynx cart, along with the
emu software. (Hey, it could happen - the Lynx does have a 6502-based
CPU, after all!)

>

Mydos 4.53 has a multi-autorun feature. It autoruns the file with the .AR0 extension first, followed by .AR1, .AR2, .AR3, etc. Only the extension counts, allowing you to identify your autorun files more easily. For example, you could have RAMCOPY.AR0 to copy files to your RAMdisk, BASICOFF.AR1 to shut off BASIC, and TURBOBAS.AR2 to load Turbo BASIC. Very handy feature, used correctly.

TJ

Also, Mydos 4.53/3 has 3-digit directory listings, to be used with programs needing directory listings completely compatible with Atari DOS 2.0/2.5.

Hi folks ...

You don't know what to do next weekend (march 21)?

Have a trip to Schreiersgrï¿½n, Germany!

There's a meeting of 8Bit atarians who shows the latest News of the german ATARI
8Bit-scene.
The meeting starts at 10:00 am and has open end, but allmost 6:00 pm.
We had a lot of fun last two years and we hope the same for this year.
Who's coming?:

R.A.M - new 256-Color pictures, 800 XL-DJ etc.
Kaisersoft - polish games and TOP-Mag
Andreas Magenheimer with last greetings from AMC :-((
Torsten Schall - Jaguar/Lynx/Hardware (his own!)
Thorsten Butschke - ATARI Computing
Frankfurt - Hardware (SIO2PC)
V.A.R. - PD-Software
Mirko Sobe - BOSS XL - Window-Desktop on XL
ABBUC - ATARI BIT BYTER USER CLUB
I hope to see you there !

Gtx. Raimund

On 11 Mar 1998 21:15:22 GMT, dklugh@iwaynet.net wrote:

Keep in mind, that HD (1.44 & 1.2MB) drives have NARROWER HEADS than
360 & 720KB counterparts. These drives can read thos densities, and
even write in them but there is a catch. A disk written with a true
360K drive will have wider tracks than a 1.2MB drive does even when it
is in 360K mode. The 1.2 will just take it's narrow tracks and spacve
them farther apart when in 360K mode. Problem is that since the head
is physically more narrow, the 1.2 CANNOT overwrite the entire track
and data written by a true 360K drive. It can only overwite a
narrow portion of it centered on the tracks made by the 360 drive.
Now then, if this disk is never put back in a true 360K only drive
then it isn't a problem. If it is though, the wide head on the 360K
drive will pick up both the data written in the narrow center of the
track and the remnants of data written by a wide head such as itself.
This results a disk which is basically unreadable/unrelibale.

I always get a kick out of all the stuff I've read in various
newsgroups about people coming up with all these crazy ways to get
data to and fro between drive types and urban legand, supersticious
remedies etc. The answer lies in the the head size. Once this simple
principle is understood, all those strange methods of why it works but
another way doesn't etc become quite clear.

If I only served to raise more questions please fell free to bug me
for a better explanation, the one I gave was hurried and could be
better for sure. I have seen this issue come up so much so many
places that I am even considering putting together text file that I
can include anytime I need to get the word out.

It would be fun to see them try the home computer/game computer
concept again using an upgrade of one of the Atari platforms. I doubt
its going to happen. We'll probably just see software and if we do see
hardware it'll be something new.

Any machine that forces you to enter Basic and type a load comnmand
certainly
doesn't start off very versatile....
And as far as "significantly more powerful overall".. If its a C64 its
usually broken
and what power does one get out of that?

Patrick...

I heard somewhere that it could supposedly do 5,000,000 polygons a
second, which if true would make it plenty powerful.

SRAM is not NVRAM. SRAM _still_ needs to have power supplied to it in
order to retain its contents. Refreshing is simply a rewriting of
data. SRAMS do not need a refresh, but they do need to stay powered
on. NVRAM (non volitile) can keep it's contents without power. NVRAM
is VERY expensive relatively speaking.

Let me ask a dumb question... if ANTIC is responsible for refreshing
an Atari8's RAM, then how come the often used trick of disabling ANTIC
to gain CPU cycles doesn't result in scrambled eggs RAM?

Just wondering.

Hmm. Its actually an intuiguing thought. Just imagine the additional functionallity it would add to a pc. It would be cool. Don't think that there is a much of a market though. Certainly not enough to make someone wealthy, but would clear up desk space for alot of people. Makes the intel/ms-dos platform a total slave to the Atari inside.

And a cool logo sticker to put on the case. "Atari inside", with the whoosh around it.

Hmmmm.............................
Bill.

Actually, the only one that really bombed was the Jaguar. Don't know much about the Lynx, but I did see it sold in quite a few places. And as for the ST, what I heard was 600,000 units sold worldwide the first year with half of that in the US. Then for some unknown reason, pulled support in the US. I know I was very confused at the decision at the time, the US is the market to sell items.

Another whoops? And who knows how the Jaguar could've done if only it had been heavily advertised. But I guess too many of the major retail outlets had gotten poor treatment with the 8-bit computers and wouldn't carry Atari products.

2837. Atari's addresses in Sunnyvale?

Date: 1998-03-15 00:00:00 UTC
From: marknewtonjohn@webtv.net
Message-ID: <6eg5hv$8k7$1@newsd-199.bryant.webtv.net>
Source record: 64696

The other day, I was in Sunnyvale finding the new home of Wierd Stuff warehouse (www.wierdstuff.com) and I realized that I was on Caribbean and Borregas, where Atari's headquarters and warehouses were. And I was wondering if all the warehouses on Caribbean used to belong to Atari.

So can anyone tell me what Atari's old addresses were? I know the main address at 1196 Borregas (was it not?), but I remember that they had quite a few buildings in the area.

True for the 5 inch drives (the 360 and the 1.2), but the 3.5 inch drive
formats are both identical when it comes to track spacing and width.
The difference is in a different data rate (frequency) written to the
disk, and perhaps a related difference in design of the gap width of
the heads (I don't know this for a fact one way or another, but a
narrower gap is a common way of extending the frequency response), but
the width across the track is still the same.

2839. Atari / C64 -- message for Commodore owners

Newsgroup: comp.sys.atari.8bit
Date: 1998-03-15 00:00:00 UTC
From: jmouchmino@aol.com
Message-ID: <19980315124501.HAA19450@ladder03.news.aol.com>
Source record: 64698

This message especially to Brix/Plush (of "Energizer" fame?) and to guys coming from the Commodore scene...

As an owner of both an Atari and a Commodore 64, I felt I had to give my opinion on these two great computers.
Let me tell you that I've been a die-hard Atari 8-bit fanatic since 84 and that I got a C64 two years ago.

Before evaluating the two machines, you have to point out two factors:
- The Atari 8-bit is 20 years old (the newer models, XL and XE, are not a revolution, compared to the original 400/800) whereas the C64 was developed in 1982;
- The market creates the machine: if your computer company can sell more than the competition, you will get better programs because the software editors will find it viable to be the best on a competitive market (this is why some SUPER games were developed for the C64).
Having said that, if I had to choose the best 8-bit machines, I would probably choose the Atari and C64 in first position, then probably an MSX computer (for the Japanese games)

You also have to be careful whether you are in Europe or the US.
An avid American Atarian will probably remember the 1981-1985 period when all the big chart toppers were developed (or ported) on the Atari.
The European fanatic, just my opinion, will probably be amazed by the new technically incredible demos from Slovakia or Poland.
This stuff has NOTHING to do with the early games you may have seen on the Atari (true, there are some very shitty programs on the Atari, but some better-looking Commodore games are also very crappy); also, the emulators don't give a perfect judgement.

The problem with the Atari seems to be (and it's not an offense when I say that, it's just plain reality for some reason) that a lot of people are still average users, whereas a lot of people on the C64 are really incredible in some areas (when will someone code something as wonderful as Mayhem in Monsterland on the Atari?); a lot of people will unconciously think that it is not possible to go beyond a certain barrier on the Atari, and this is just not the case.
But then again, the market creates the machine...
Maybe the Atari is more difficult to master than the C64, but I think that a lot of people were unaware of the possibilities of an Atari in 1984-85 (and many people still are - there again, it's not an offense, it's just the way things are); besides, the English were not interested in the Atari.
Nowadays, whereas German/Slovakian/Polish support is really strong, the American "scene" is more concentrated on hardware than entertainment (demos/games).
It also seems that a lot of people (please tell me if I'm wrong) are unaware of

what exists in Poland and Germany, which penalizes the users: a lot of people use very old tools to program games (in the US for instance - don't kill me, I think this is really the case), which gives you the feeling that you are in 1982 and not 1998 (and I don't think the PAL-NTSC differences are a problem, it's just that there was nothing solid to build on ==} no demo scene in the US for instance).

As for technical comparisons, I can tell you that the two computers are very close, but maybe the Atari is more difficult to master...
I feel sometimes the time that the Atari can do much, much better; blame the programmers (or rather lamers), not the machine (maybe a vote for the most horrible games would be nice...).
CPU - both 6502-based (6510 for the C64) with specialized chips on the Atari.
GFX - C64=320*200, Atari=320*192: the Atari has lots more colors (256) but they are harder to implement in max resolution (but look at the plasma fx on the Atari in some recent demos!!!).
Sound - the C64 has real synthesized sound (the SID chip is something fabulous) and the Atari has 4 voices (although on 3.5 octaves each only); some games really DO sound lame, but the musics made after 87 (Europe) are pretty nice, really, and it's way better than Amstrad or ST sound... (I just wish 16-bit sound and filters were used more often).
Scrolling capabilities: difference is really minimal, when it's nicely programmed...

If you really want to see the Atari 8-bit at its best, pick up an 800XL (or 130XE) rather than an 800 and a 1050 or double density drive (the 810 belongs to the museum, as it can only store 90K per disk side); check out the gfx/sound on the new Polish demos (Drunk Chessboard, Overmind, Total Daze...), which are REALLY impressive!

For games, all the 1979-1985 classics are available on the Atari, and nearly all are super conversions which are immensely playable (Defender, Donkey Kong, Bouldr Dash, Dropzone, Alternate Reality and a million more); there were very few things between 85 and 88, until Zeppelin (England) brought out some very cool stuff (Zybex and Draconus are fantastic).
Then came the Germans and the Polish with solme nice clones of classic games (Operation Blood is Operation Wolf, Brundles is Lemmings...).

All in all, I think the best is to have BOTH computers; people who famished all these years and had the courage tokeep their Ataris can be happy now, as the scene has never been so active!
If you know where to go, Europe is really the place to be for an 8-bit Atarian!
If you are in Germany, Brix, check out the ABBUC club (see info in the vendors/developers list); it's the best club ever for the Atari!

Tschuess,
Bertrand.

Assuming all of that info was correct, it looks to me like the C64 had
better sound and its sprites may have been better for many purposes
than Atari's player-missile graphics, but Atari had better graphics
and ran 70% faster (or does the 6510 use fewer cycles per instruction
than the 6502?).

Did I miss anything?

Of course, that's just comparing the hardware.

The ST sold around 4 to 7 million units world wide.
The Atari 7800 sold around three million units.
The Lynx sold around 1 to 2 million units
The Jaguar sold around 250,000 units
The Falcon sold around 30,000 units but they sold all that they made
so who knows what the sales possiblities were?

Starting with the Lynx and on, it appeared that Atari was trying to
commit suicide. Atari did everything they could to mess up the Lynx.
From poor advertising (when they did advertise), to snubing major
retailers.
The Jaguar has problems. Lets leave it at that.

The C-64 used the 6510. This was a variation of the 6502, but not
the same. Also, the later Atari's (XL/XE) used the 6502C which was a
slightly modified custom version for ATari only.

I think that it's unfortunately truth. SID has better features than
POKEY and C64 has more sprites.
Even VIC is (in a part) better that ANTIC if we will analyze interlace
features and fonts' graphics (I mean that VIC can scroll by one pixel
line in 16 color graphics mode which is made of 2 pixel points).
Atari is faster, that is a fact, but demos on C64 are much better coded
than in Atari...
It is a bitter reality, but it is never too late for change!

Message-ID: <350C1297.E4D44E30@friko.onet.pl>
Source record: 64707

ANTIC always refreshes DRAM memory even if it's disabled ($d400=0). It is easy to check when, just try to made color change during line is made. CPU works slower during the left side of screen is displayed. Many of DRAM's need to have more or less than 8 refresh cycles, so they can not work with ANTIC. There must be additional chip.

I have an Atari 7800 and have found it to be a unique game console. For starters it is the only console that can play a previous console's (2600's) cartridges in the same slot as its own more advanced carts.

I don't know the specs, but it seems like this system is superior to the original Nintendo system. For some reason Nintendo took off but the 7800 died. But few of the 7800 software titles lived up to the machine's potential. I have a version of Galaga which is good but you don't get the higher level insects from the arcade game. I get the suspicious feeling this is nothing to do with the tech limitations and everything to do with a rushed or halfhearted programming job. Same thing with Dark Chambers, which attempted to be Gauntlet, has all the tools and graphics, but falls way short in play value.

Anyone know the specs of the 7800? How does it stack up against the Nintendo? It has great graphics. I would have loved to see some expansion options like a keyboard or disk-drive.

That is very good idea! On C64 they have FTP and E-MAIL.... But all that
stuff is easy to code, the hardes thing is TCP/IP protocol (PPP). On C64
they already have one! We have just need to transfer it to Atari and
make some small changes (like changing adresses and communicating with
modem). If anybody have TCP/IP from C64 please contact me! I am able to
do that. Then we can start to think about WWW browser, but firstly
E-MAIL and FTP (that is the easiest ones).

UTIL and MYUTIL are DOS utilities that allow a PC to read/write DD 180K
Atari format disks. Unless your 1050's have been upgraded, they aren't
capable of double density.

There is one utility which allows the 1050 to read 180K PC-formatted disks.

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

Give up graphical web browsing with the Atari8. It is not up to the
task, not even close. Lynx is fine, but forget the graphics. I love
my Atari8 and I know that inspiration for new hardware or software
should be encouraged, but that being said those of you who think to do
any kind of remotely serious graphical web browsing on your Atari8 ore
delusional.

It's not word processor code but rather HTML. It equally does NOT belong in news articles. You can thank Nutscrape & Mickysoft for deciding to allow handling (and thus encourage the practice) of HTML in a news reader. HTML belongs on HTTP servers, not in email, news, FTP servers, or anywhere else on the net. This is a violation of nettiquate.

That's fine if you "don't do Windows" but you leave YOURSELF out in
the cold. Part of the sacrifice you make for not using the most
popular OS on the PC today. I'm not saying Windows is the best or
worst, or if you should or shouldn't use it. I am only saying that if
you choose not to use it you aree depriving yourself of a large
software base entirely by your own choice.

Possibly! ;)

Project X (I think it is also called Merlin) is a new game system
designed by VM Labs. Many former Atari people worked on the design,
including one or two of the engineers who designed the Jaguar and
Midsummer machines, and programmer Jeff Minter (Tempest 2000, Llamatron,
Defender 2000, and so on.) And Bill Rehbock, another former Atarian,
left his position at Sony to head up the recruitment of third party
developers for Project X.

The marketing model sounds similair to the 3DO - multiple manufacturers
sign a license to build hardware. There are supposedly several "Sony
sized" manufacturers already signed on, but the only one known at this
time is Phillips. They have said we will learn a lot more at E3.

It is the clear Atari connection to the hardware's designers that makes
many people feel like this console will be the unofficial heir to the
Atari legacy. In fact there was a rumor that Phillips was seeking to
license the Atari name from JTS for their model of the Project X
console. So while their is no concrete connection between Project X and
Hasbro's purchase, many of us hope that there will bo one eventually.

I built the following equipment into a box 4" x 8" x 12"
130XE
XF551 upgraded to 3.5"
PR connection
and a switching power supply to power everything (inside as well)
the Keyboard was mounted on top....
Not very pretty but physically done....

The Atari warehouses were all along that block. In fact, when I picked up
my Jaguar Kiosk, the warehouse it was in was around the block from the new
Weird Stuff location.

In fact, the two huge buildings that you see as you drive onto Carribean
from the Lawrence Expressway used to be Ataris. IN fact about 8 years ago
a friend and I tried peering into the windows there. I was tempted to
abscond with one of the parking sign ("Parking for Atari employees only"
but decided that that would be a bad idea.

Excuse me...but BS. I have seen a LOT of Commodore computers and I've seen comparitively much fewer numbers that were broken. For the record, having worked on both Atari and Commodore computers (having worked in a repair shop that WAS ATARI authorized), the Commodore stuff was generally more repairable than the Atari computers.

And as for the BASIC, you must know something about Basic 2.0 that I don't, namely that you are forced to use BASIC and nothing else. Give me a break. If you don't want to use the BASIC, DON'T USE IT. So what if you have to start the programs from basic?

Sheesh...same stupid crap every time a flame war starts. Both machines have their strong points, can we leave it at that?

> called "Atari".

I've think you've got the right idea. Stealth PR is not a bad idea.
Besides, I think we can all safely say that Atari's public enemy #1 is
the press. Judging from the Jaguar press that was received, "Jag is not
64-bits" "Jag is 16-bit" "Jag uses two 32-bit processors in tandem"
yadda yadda yadda. Basically I think the Atari name needs to stay out of
gaming magazines since most of the writers for these magazines are
idiots.

Basically, good private PR and a big CES showing would be the prescribed
medicine.

I wouldn't get my hopes up for any more Atari Computers period. After all, Atari computers division lost all of their computer development team (that's the ST/TT and Falcon crowd), they'd either have to track down the old people (which have jobs elsewhere) or get new people (which would require training/learning time).

I think it far more likely that we'll see Atari games for the PC or other platforms, and possibly a re-release of the Lynx or something of the sort.

Yes Indeed I do know that SRAMS do require a power source, but this could be supplied by batteries in the case of AC power outage unlike DRAMS. I was thinking about something like Flash RAM. Though I have no idea as to the cost, I am sure that it isn't cheap. Which ever way I do decide to build my unit. I am sure that it will be interesting. Will keep you posted.

Gee I wish that I would of stated that in my original post. These are some
of the alternative ways. You could even use a good sized cap to do the job,
though this method would not be able to supply power for any lengh of time.
Actually I would opt for a small ni-cad battery pack that would fit inside
the case and all. But with this you will need a way to keep the battery pack
fresh (Charged) Look at all the possibilities!

As a 1200XL owner, I cannot verify the second one is definitely NOT
for the 1200XL (it used a 9VAC power supply, like the old 800, 1050,
etc.).

In fact, I do not know of any 8 bit Atari brand equipment that used a
dual-voltage DC supply. I suspect it may be the power supply for an
external (SF314 or SF354) disk drive for an Atari ST.

For those who need a 5V XL/XE power supply with more output than the
standard power supply Atari provided, Halted Specialties
(http://www.halted.com), sells a 5 volt switching power supply that
outputs up to 3 amps for $5.95. As you might expect, however, it is
not "plug and play", as it uses a different connector (a 4-pin
mini-DIN, the same as an S-video connector). However, you can either
buy a 7-pin DIN (they sell those also, for 95 cents each), or if you
have a dead XE/XL power supply, use the cable or connector from it,
and save the 4-pin mini-DIN for building a Atari to S-video cable.
<grin>

You will also need a standard IEC power cord (the type that plugs into the back of a PC power supply as well as many other types of computer equipment that have a detachable power cord). As you might expect, they sell these for $2.49 (straight or right angle). While not the lowest price I have seen on this (that honor belongs to ComputerGate International), it is better than your local Radio Shack. Also, since HSC has a $10 minimum order, and a $2 handling charge for orders under $20, you would need to order either more than one power supply or other goodies to meet the minimum.

Why You want to use this old assembler? In Europe, we're using Quick
Assembler!
It's the best 6502 assembler for A8! Full screen editor, mini debugger,
etc.
It works very well under XL IT! or X-former. I recommend You this
powerful tool!
Any questions? Write on priv, please!

Well that means that my Duplicator 1050 should be alright.But not the Trak.
So any ideas why my Duplicator 1050 is having problems reading certain sectors
of disks that other drives (like my late Indus GT) can read?

> and Z80 chips.)

For clarity...the reason that there are letters after the Z80 (i.e.
Z80A, Z80B, Z80C) is because those A, B, and C characters stand for the
speed: A is 4MHz, B is 6MHz, C is 8Mhz (yes, they made an 8 MHz chip...I
bought one...can't find it now...grrr).

Zilog no longer uses the A, B, C speed notation, instead replacing it
with -4, -6, and there is no longer an 8Mhz version apparently (at
least, they don't include it in any of their new databooks).

This is true. They usea 65C02 in the Atari Lynx too. I would tend to
believe that the C after 6502 indicates a CMOS version.

I don't know if I'd classify the ST as a "cheap" design. After all, some prominent computer experts, including Dr. Jerry Pournelle, liked the ST more than the Amiga. However, it may be true that it was put to market too early. Early models didn't include the BliTTER, for example...

I suspect that what happened with the ST is that since Amiga was slipped out from under Atari by Commodore, they wanted to have a product to compete, and wanted to get to the market at or before the Amiga made it so that they would have a fighting chance.

It's already started in PC's, where the advice "buy as much machine as
you can, to avoid obsolescence as long as you can" has been replaced by
"buy as cheap as you can since the most expensive system will be
obsolete next week anyway." Accordingly, the $1000 and under PC's have
taken off by some estimates to equal up to %70 of sales. The only
problem with seeing this extend to game consoles is that their $150 to
$200 cost doesn't carry the sticker shock of PCs' considerably higher
price tags, making a cheaper "oldie" console (a Super Nintendo, for
instance) not that attractive to gamers demanding the latest.

I agree. Until its death in fall 1995 forced us into buying a PC, our
800XL did everything we needed for word processing and databases, and in
fact found Atariwriter Plus easier to use than the Unix word processor
we had to use at the time at my job!

And considering how they too are a Wintel victim like Atari, there's no
point in bashing them at this point in the game.

The fellow that wrote Mapping the 64 stated that he needed 2 working
64systems in order to write the book. He had to open 10 OF THEM before
he got 2 working. I have seen a number of repair shops in the past that
worked
on both and all of them had returns on NEW units. I have never seen an 8
bit
Atari system fail out of the box.
Next, during the BBS hay-days a freind of mine kept close tabs on local
BBS systems
and what computers the sysops were using. Atari systems were up for
years, 64 were
down often ands died quickly. I currently run an Atari board that has
had one console
failure in 10 YEARS!
I am a technician, for me reliability is very important.

> And as for the BASIC, you must know something about Basic 2.0 that I

I buzzed out the pad a long time ago and the pins associated with the A
and C buttons
were connected to the paddle inputs (If I remember correctly) and will
pose no problem.
I do remember satisfying that very concern.....

> set my mind
> > at ease.)

As far as frying the C64, Yes, that is a definite possibility since the
only pins common
to both machines were the joystick pins. Since the connector was 9 pin
and 6 were used
for the joystick (5 input and one ground) that left 3 pins, two for the
paddle and one +5V
I do remember the configuration being different so that means +5
directly to ground if you
hit one of the two (A or C) buttons. The Atari had the +5 in the safe
location.

That is an all-too-common theme of many of these messages, but lets be realistic here. Granted, the Tramiels marketing blunders obviously doomed TOS to eventual failure in the marketplace, but without the Tramiels, Atari would have been dead and burried in 1983 after Warner Communications ran the company into the ground. Without the Tramiels, there would have been _NO_ Atari 130XE, 520ST, 1040ST, Portfolio, STe, MegaST, SLM804, MegaSTe, SLM605, TT030, Falcon, Lynx, Jaguar, etc.

As frustrating as all the Tramiel's marketing blunders obviously are to us diehard Atarians, keep in mind that without them, we wouldn't even have had any of these incredible systems. Because of these systems, we Atarians were able to enjoy user-friendly operating systems and software a full decade ahead of the rest of the personal computer industry, and a reliable, frustration-free operating system that is still unequalled even by today's most current systems.

We have a disagreement in philosophy about this. My position is more form the standards side. To better clarify what I was saying, I do not feel HTML belongs in places where the specification for those places do not include it. If the standards and specifications are updated or amended to include HTML I have no problem with that. When it is declared official internet standard, then email and news clients will be written or updated to that standard and then there is no problem. You speak of liking to be able to use non standard methods to enhance your ability to express yourself in newsgroups, yet for those who do NOT use NUTSCRAPE NEWS or MICKYSOFT NEWS, your very efforts to enhance your message in fact serve only to clutter, cloud & obscure it.

I happen to use Forte's Agent for my news. It is 100% complient to the news and email standard. It is also a very cool kick butt news reader. What it is not is HTML interpreter, nor should it be unless HTML becomes an official part of email or news.

Hi all,

I have a 256k XL LM RAM upgrade kit for Atari 800XL computers complete with 256k of RAM, manual and MyDos 4.1 disk. I also have a brand new RamRod XL thingy. This unit alows you to switch between 3 Atari OS and can also be used with the 130XE. These 2 units are brand new in the box and are complete. I'm not sure what they are worth, so I thought I'd offer it to someone in this newsgroup. Best cash or 8-bit cart offers get 'em. Please see my web page for a list of what game carts I already have(I want anything I don't have) http://www.ticon.net/~save2600

Actually, I think they used the 65C02. The 6502C was different still.
I know Mac/65 supported the 6502C extended instruction set, but Atari
never shipped a computer which used such a chip. It was something
somebody could plop in after market.

You've switched the names. Here's the way I understand it (from my experience
with Apple machines):

- As far as I know, the 6502C is just a "stock" 6502 -- chip makers
tend to add letters to the end of their product numbers after making
minor changes. (Intel and Zilog did the same thing with the 8080
and Z80 chips.)

- The 65C02 is not a stock 6502. It replaces the 6502's undocumented
opcodes with different documented instructions. (They provide new
addressing modes for some instructions, and new instructions like
Branch [relative] Always, stack instructions, etc.) I would guess
that the 'C' refers to CMOS. I think the original 6502 was made
with NMOS logic but I'm not sure. Apple used this chip in the //c
and its descendants.

That simply isn't true. The Atari ST was a cheap design. It was designed too quickly with no real innovation (try to think about the Sinclair QL, which was almost the same design and was produced 2 years before, or about the Amiga which was first introduced as a prototype a whole year before the ST).

The Tramiel management was very chaotic. They failed in marketing the computers. They also failed in designing them (come on, the Mega STs were more or less multi-megabyte memory STs in a new box, no magic here). They had this poor policy of making announcements about new designs years before actually producing them (or even not producing them).

Also, the Lynx was not created by them. It was bought from Epyx.

Granted, without the Tramiels, Atari's story would have been very different : we don't know who would have bought it back from Warner. But the Tramiels leading Atari was a total failure.

Concerning demos:

I don't agree completely.
If you look at the most recent demos on the Atari, you'll notice they are very close to Commodore stuff.
Sure, pure SID sound beats POKEY and the animation can be slightly smoother on the C64, but apart from that, it's a tie.
The Atari is maybe harder to master than the Commodore, but also don't forget that there are a lot fewer Ataris than Commodores; there again, the market creates the machine (if you only have a few people working on a computer, you won't get very far, even if you have the best machine).
Greetings,
Bertrand.

Indeed. In fact most people I talk to think Atari died in 1982-83. Few people have even heard of the ST series, the Jaguar, the Lynx, Portfolio etc.

Actually, part of the reason Atari UK started to look at doing lots of
retro style titles for the jag was because they were starting to get
shitloads of revenue from the various companies selling versions of their
old titles from the 70's/80's.

In the late 80's in Europe, the ST outsold even IBM in terms of volume of
'personal computers' i.e. they sold moire STs than IBM sold PCs. Atari was
in fact 3rd highest seller by volume at one point.

Agreed.

>goodies, we have Sprites, but Atari call them Players, 4 of them and 5

Player/Missile Graphics (PMG's) were way inferior to the C64 sprites. I mean,
4 players 128/256 pixels high and 8 pixels wide in only one color plus 4
missiles only 2 (!) pixels high are nothing compared to the C64's sprite
capabilities (Yeah, I know the 4 missiles could be used as a 5th sprite and
that combining two players would give you 2 players with 4 colors each).

>sprites, and about why i think the A8 is better: Interrupts, we can handle

>describe all the goodies in an A8.......

Having 17 graphics modes says nothing about the quality. I would really
liked to have a 320x200x4 mode like the C64 (or did it even have 16 colors?).
To me, the main advantage over the C64 was the ability to mix different
modes as you pointed out above. Also, don't forget the higher CPU clock.
BTW everybody always talks about 256 different colors but in fact there
are only 120 distinct colors in most modes except for the GTIA modes which
have 240 distinct colors.

Alex,
First off, only use very small files for attachments. Second, don't do this often as this is not really a place for binaries. The ocassional file attachment (90K or less recommended) seems to be no problem. Now, Netscape does allow MIME Base-64 in-line attachments to be added to news/e-mail. Simply create a new message/reply message. Then click on the Attach button, locate and 'tag' the file. It will be listed at the top with its source path. Pretty simple, actually.

The MIDI ports were pretty radical at the time and still are to an extent.
It also had a huge amount of RAM compared to other machines, even PCs and
Amigas although both soon matched and then beat it in that department.

Agree with everything else though!

This is not a binary newsgroup and attachments should not be sent here
unless you want a flaming. Best to say you have a file and ask for
interested parties to ask for it directly.

"Util" runs on an IBM-compatible, not on the Atari 8-bit. If
you're trying to use the Atari 8-bit to read disks created by
MS-DOS (not "Util") on an IBM-compatible, then you'll need to use
some other Atari program (an MS-DOS-reading utility, if there is
such a thing) in order to do that.

"Util" works only on disks formatted in the Atari style of
what 8-bitters call double density (D.D.), or 720 sectors of
256 bytes each, adding up to a total of 180K capacity for one
side or 360K for both sides. You can use "Util" to format a
disk and then write to it, but then you'll need a double
density-capable disk drive to read that disk on the Atari 8-bit.

Unless your 1050s have been modified for double density (like
with a "U.S. Doubler"), then what you have is single density (128
bytes per sector) and you won't be able to read disks written to
by "Util." And even if your 1050s have been modified, you need
to use a double density-capable DOS program. 2.5, 3.0, and 2.0s
are NOT double density-capable. (There is a D.D.-capable version
of Atari Company DOS 2.0; it's called 2.0D.)

DOS-XL (which came with Indus drives but was a product of
Optimized Systems Software, or O.S.S.) is double-density capable,
and can be used to read disks created on an IBM-compatible with
"Util." But first you need a double density disk drive, and then
(if you haven't already done so) you need to use DOS-XL to create
a double density master DOS disk for when you either boot up in or
reconfigure to double density.

Assuming that your 1050s have been modified for double density,
it's best to use the Atari drive to D.D.-format a disk for use
with "Util" on the IBM-compatible. That'll improve the chances
of your being able to successfully read the disk on the Atari 8-bit.

I'd say there is probably a _very_ limited market for 1-dimensional
games. But, what are we talking about here?

Yup. Now, whether the 1541 was a 65C02 or a 6502 is a debate, but I'm
pretty sure it was the 6502 (NMOS?).
